1 Introduction

This handbook provides information of a general nature, and also information about course structures and individual modules, for students who expect to enter, in September 2012, the third or fourth years of one of the following degree programmes:

- the three-year BSc Mathematics programme;
- the four-year MMath Mathematics programme;
- the four-year MMath Mathematics with Study in Europe programme;
- the four-year BSc Mathematics with Study in Europe programme;
- the four-year MMath Mathematics with French, German or Spanish Language programme;
- the four-year MMath Mathematics with Year Abroad programme;
- the three-year BSc Financial Mathematics programme.

This booklet is particularly aimed at those students who are in their **second** year in 2011–2012 of the Single Honours BSc or MMath Mathematics programmes.

The MMath degree is designed above all for those who enjoy mathematics and appreciate a challenge. It will be particularly appropriate for those who are considering careers as professional mathematicians or statisticians (for example, as researchers in industry or higher education). The BSc degree emphasizes problem solving, conceptual and abstract thinking, and communication skills. University Regulations state that students can normally continue into Level 3 of an MMath programme only if they have obtained 120 credits at Level 2 with a weighted mean grade of at least 59.5 at first sitting.

This booklet contains essential information to help you to make informed choices; it will be useful throughout your third (and fourth) year. You are welcome to seek further information or advice from your personal tutor, the Senior Tutor or Programme Leader for your degree programme.

Dr. A.F.Jarvis, Director of Teaching, SoMaS

2 Disclaimer

Every care has been taken to ensure the accuracy of the information in this booklet. To the best of our knowledge it was correct at the time at which it was prepared. The School of Mathematics and Statistics cannot accept responsibility for any errors which could occur should there be any further modification of the Regulations.

There have been a number of staff changes in the School in recent years with several new lecturers arriving and some older staff leaving. Further changes of this kind may well occur. Courses at Levels 3 and 4 are specialized and the School cannot guarantee to run a course for which the qualified lecturer leaves. On the other hand additional options may be offered when staff with new interests arrive. Also, there could be changes in the syllabus and timing, particularly of courses in 2013–2014.

In addition the School reserves the right to withdraw courses for which the number of students registered is very low.

3 Administrative Information

Dates of Semesters

Session 2012–2013

2012				
24 September	–	15 December	:	Autumn Semester Teaching Period (12 weeks)
2013				
14 January	–	2 February	:	Autumn Semester Examinations (3 weeks)
4 February	–	16 March	:	Spring Semester, First Teaching Period (6 weeks)
8 April	–	18 May	:	Spring Semester, Second Teaching Period (6 weeks)
20 May	–	8 June	:	Spring Semester Examinations (3 weeks).

Session 2013–2014

2013				
30 September	–	21 December	:	Autumn Semester Teaching Period (12 weeks)
2014				
20 January	–	8 February	:	Autumn Semester Examinations (3 weeks)
10 February	–	5 April	:	Spring Semester, First Teaching Period (8 weeks)
28 April	–	24 May	:	Spring Semester, Second Teaching Period (4 weeks)
26 May	–	14 June	:	Spring Semester Examinations (3 weeks).

Organisation of Modules

Most Level 3 and 4 Mathematics and Statistics modules are delivered at the rate of **2 hours of lectures per week**; project modules are among the exceptions to this. Your lecturers will make appropriate arrangements for times when you can consult them.

Choice of Degree Programme

Those of you registered for an MMath degree now have to decide whether to remain on the degree, or to transfer to the three-year BSc Mathematics degree. It will be necessary for you to obtain 120 credits at Level 2 with an average of at least 59.5 at first sitting in order for you to progress to Level 3 of the MMath degree, and therefore if you do **not** achieve this then your transfer will be automatic. If you decide to transfer to the BSc degree, then your local authority will be notified by the University. For this reason, you should **not** elect to transfer to the BSc degree unless you are absolutely sure of that decision. It will be possible to make the change when you return after the summer vacation, although we anticipate that most students will have made a decision one way or the other by the beginning of the summer vacation. It is also (normally) possible for you to transfer from an MMath programme to a BSc programme during your third year, but please note that you would only be able to take part in the Degree Ceremony in July 2013 if you transferred by March 2013.

Those of you registered for a three-year BSc degree programme may also decide that you wish to transfer to a four-year MMath programme (assuming that you obtain 120 credits at Level 2 with an average of at least 59.5). The right to switch is not automatic, even with 120 credits at Level 2 and an average of 59.5, and you should discuss your situation with the Senior Tutor. You are also advised to consult your Local Education Authority or other funding body to check that they have no objection.

Choice of Modules

Once you have decided on your degree programme, you will need to decide which modules you wish to take in the coming year, or two years if you are to take the MMath. This choice can certainly be regarded as provisional at this stage; however, you should try to decide on a probable selection this semester while you are in a position to consult staff in the School.

Each year you must choose modules to the value of **120 credits** in accordance with the Regulations for your degree.

Online module choice in 2012 runs from 30 April – 18 May. You should ensure that you submit your choice of modules during this period. Details of the operation of online module choice will be given separately.

There are good reasons why it is strongly advisable that MMath students should plan their choices for both of their final two years. There is a requirement that graduates from Masters programmes should take at least 120 credits of Level 4 modules (i.e., those modules with codes MAS4**). There is a requirement that at least 40 credits of Level 4 modules are in the form of project modules, but this still leaves MMath students (including those whose third year is spent abroad) needing to take a further 80 credits[1] of other Level 4 modules. Such Level 4 modules often have Level 3 prerequisites, so you need to be sure that you acquire the prerequisites in 2012–2013 (**even if you are studying abroad**) for the Level 4 courses you are to take in 2013–2014. Secondly, some Level 4 courses are enhanced versions of Level 3 courses and so cannot be taken after the Level 3 courses on which they are based. Again, you need to ensure that your choice of options leaves you with a desirable choice for the fourth year.

Further, on the last page of this handbook you will find a **provisional** timetable for 2012–2013. You will notice that most of the courses are arranged in 'blocks' consisting of courses which will have the same timetable. Clearly you cannot take two courses in the same block in the same semester.

Unrestricted Modules

The term **unrestricted** means you are free to choose either a mathematics or a statistics module or one outside the School of Mathematics and Statistics. The marks from such modules are used in assessing your final degree classification.

It is **your responsibility** to determine the prerequisites and timetable for any non-mathematical module and to obtain academic approval from the department which owns the module.

Note that some mathematics and statistics modules **cannot** be taken with certain modules from other departments; details are included in the information on individual modules.

You may not generally choose Level 1 modules as unrestricted modules at Levels 2, 3 or 4; exceptionally, modules from the Modern Languages Teaching Centre (MLTC) may be permitted. You are also advised that the School will not permit its students to take any mathematical module from another University department as an unrestricted module at Level 2, 3 or 4.

Change of Choice of Modules

The University allows you to change your choice of modules in the first three weeks of any semester. **If you do change your options early in a semester it is your responsibility to ensure not only that your timetable for that semester works but also that you will have suitable options available in future semesters for you to be able to complete your degree** (for example, you will have covered all prerequisites for your future choices). To make the change you must obtain an 'Add-Drop Form'. These are available from the Student Services Information Desk (SSiD) in the Union of Students, and can also be downloaded from the SSiD web site at `http://www.shef.ac.uk/ssid/forms`.

When you have completed the form, you must have it signed, to signify the School's approval, by the Programme Leader for your degree programme, or by the Senior Tutor:

[1] MMath Mathematics with French/German/Spanish Language students are required to take, in their fourth year, the 40 credits of compulsory project modules, but only 40 further credits of Level 4 SoMaS modules; their remaining 40 credits in their fourth year comprise study in the foreign language.

see the list of members of staff authorized to sign such forms at http://www.maths.dept.shef.ac.uk/maths/who_signs.php. The form should then be handed in at the SSiD.

You can access the record of your choice of modules on central records. You **must** check that this record is correct in the fourth week of each semester. If it is not correct obtain an Add-Drop Form and take appropriate steps to correct it.

Progression into the Third Year

Since your Level 2 results contribute to your overall degree classification (unlike your Level 1 results), the rules for progression from Level 2 into Level 3 are slightly more involved.

For students on **BSc** degree programmes, the rules for progression from Level 2 to Level 3 are given below, and apply to the January and June exams taken together:

(i) You may progress to Level 3 without any resit if you have obtained 120 credits in your Level 2 modules.

(ii) The Examiners have discretion to decide whether students who have been awarded 100 or 110 such credits may be deemed to have passed at Level 2 and permitted to proceed to Level 3. Permission to proceed in these circumstances is **NOT** automatic.

If you have obtained at least 100 credits but have failed one or two modules at Level 2, then

- (a) you are **strongly advised to resit** any failed modules (even if the Examiners permit you to progress), because in all cases there is a minimum number of credits that must be obtained (over the second and subsequent years combined) if the degree is to be awarded.
- (b) Students who are permitted to progress into Level 3, but who do not have the full 120 credits at Level 2 are permitted to resit Level 2 exams during their Level 3 year (but only one resit is permitted for any module).

(iii) If you have only **90 or fewer credits** then you must resit **ALL** the modules you have failed.

If you wish to retake failed modules you should follow the instructions at http://www.sheffield.ac.uk/ssid/exams/reassessment_ug.html. Any international student who wishes to take August 2013 resit examinations in their home country should apply to do so by the end of the Semester 2 examination period 2013.

The maximum score that can be credited as a result of a resit examination is 40.

Students on an **MMath** programme must obtain 120 credits at Level 2 with an average of at least 59.5 to be permitted to progress to Level 3 of the same programme; those who do not meet this requirement will be transferred to a BSc programme.

Progression into the Fourth Year

The Examiners may in their discretion recommend that a student on an MMath programme who is awarded not fewer than 100 credits at Level 3 and who obtains a weighted mean grade of not lower than 54.5 at Level 3 be permitted to proceed to Level 4.

This is **not** automatic, and students towards the bottom end of this region, or students with any fail marks, should **not** expect to be permitted to progress; experience has shown that such students struggle with the additional difficulty of Level 4. If students are not permitted to progress, then students may be eligible for a BSc degree.

A student who is permitted to progress from Level 3 to Level 4, with fewer than 120 credits from the Level 3 year, may resit failed Level 3 modules once during the Level 4 year. The resit mark will be capped at 40, but if the resit mark is lower than the original, the higher mark will be used in the final assessment.

Degrees with Employment Experience

The University of Sheffield recognises that both students and employers value the benefits that structured work experience can provide as part of a university degree programme. With this in mind, you can now choose to undertake a Degree with Employment Experience by participating in a year-long work placement.

Under this scheme, you spend your penultimate year (i.e., the year between Levels Two and Three of a three year degree, or between Levels Three and Four of a four year degree) in employment. This would then increase the length of your degree by a year. If successful, you will get a degree, the title of which bears the suffix 'with Employment Experience'.

The placement should involve work connected with your degree programme or with your proposed future employment. We recognize that many mathematics graduates go into graduate jobs which do not use their degree directly, so a placement with, say, an accountancy firm would be as acceptable even if it did not involve the use of university-level mathematics. Students need to find their own company placement and Professor Zinober, who administers the SoMaS scheme, should validate the placement.

You will need to start planning for this a year before your placement starts. You are responsible for getting the placement, but the Careers Service will assist. You will need the approval of the department (or departments in the case of dual degree students), and when the placement is arranged, you will transfer to the appropriate 'with Employment Experience' degree programme. Entry to these programmes is only by transfer from normal degree programmes, which is why they do not appear on UCAS forms.

Your placement will be assessed on a pass or fail basis. It will not count towards your final degree classification; however, you will need to pass the formal assessment and complete the placement year in order to gain the amended degree title and graduate with a degree with employment experience. You will be required to complete and submit:

- Placement Journal (25%) – skills based journal, completed whilst on placement.
- Analytical Report (50%) – submitted at the end of the placement year, approximately 3000 words focusing on either: a critical evaluation of a management or technical

issue that you have identified during your placement, or a critical evaluation of a project you have worked on during your placement.

- Presentation (25%) – upon your return to University you will be required to give a short presentation to your peers focusing on the skills you have developed during the placement year.

For further details, see http://www.shef.ac.uk/placements/index.html.

Avoiding Collusion and Plagiarism

This has been extracted from the University's *Guidance for Students on the Use of Unfair Means*, available from the SSiD web page at http://www.shef.ac.uk/ssid/exams/plagiarism.html.

The University expects its graduates to have acquired certain attributes. Many of these relate to good academic practice.

Throughout your programme of studies at the University you will learn how to develop these skills and attributes. Your assessed work is the main way in which you demonstrate that you have acquired and can apply them. Using unfair means in the assessment process is dishonest and also means that you cannot demonstrate that you have acquired these essential academic skills and attributes.

What constitutes unfair means?

The basic principle underlying the preparation of any piece of academic work is that the work submitted must be your own work. **Plagiarism, submitting bought or commissioned work, double submission (or self plagiarism), collusion** and **fabrication of results** are not allowed because they violate this principle (see definitions below). Rules about these forms of cheating apply to all assessed and non-assessed work.

(i) **Plagiarism (either intentional or unintentional)** is using the ideas or work of another person (including experts and fellow or former students) and submitting them as your own. It is considered dishonest and unprofessional. Plagiarism may take the form of cutting and pasting, taking or closely paraphrasing ideas, passages, sections, sentences, paragraphs, drawings, graphs and other graphical material from books, articles, internet sites or any other source and submitting them for assessment without appropriate acknowledgement.

(ii) **Submitting bought or commissioned work** (for example from internet sites, essay "banks" or "mills") is an extremely serious form of plagiarism. This may take the form of buying or commissioning either the whole piece of work or part of it and implies a clear intention to deceive the examiners. The University also takes an extremely serious view of any student who sells, offers to sell or passes on their own assessed work to other students

(iii) **Double submission (or self plagiarism)** is resubmitting previously submitted work on one or more occasions (without proper acknowledgement). This may take the form of copying either the whole piece of work or part of it. Normally credit will already have been given for this work.

(iv) **Collusion** is where two or more people work together to produce a piece of work, all or part of which is then submitted by each of them as their own individual work. This includes passing on work in any format to another student. Collusion does not occur where students involved in group work are encouraged to work together to produce a single piece of work as part of the assessment process.

(v) **Fabrication** is submitting work (for example, practical or laboratory work) any part of which is untrue, made up, falsified or fabricated in any way. This is regarded as fraudulent and dishonest.

How can I avoid the use of unfair means?

To avoid using unfair means, any work submitted must be your own and must not include the work of any other person, unless it is properly acknowledged and referenced.

As part of your programme of studies you will learn how to reference sources appropriately in order to avoid plagiarism. This is an essential skill that you will need throughout your University career and beyond. You should follow any guidance on the preparation of assessed work given by the academic department setting the assignment.

You are required to **declare that all work submitted is entirely your own work**. Many departments will ask you to attach a declaration form to all pieces of submitted work (including work submitted online). Your department will inform you how to do this.

If you have any concerns about appropriate academic practices or if you are experiencing any personal difficulties which are affecting your work, you should consult your personal tutor, supervisor or other member of staff involved.

The following websites provide additional information on referencing appropriately and avoiding unfair means:

The **Library** provides online information literacy skills tutorials `http://www.shef.ac.uk/library/services/infoskills.html`

The **Library** also has information on reference management software `http://www.shef.ac.uk/library/refmant/refmant.html`

The **English Language Teaching Centre** operates a **Writing Advisory Service** through which students can make individual appointments to discuss a piece of writing. This is available for all students, both native and non-native speakers of English. `http://www.shef.ac.uk/eltc/services/writingadvisory`

What happens if I use unfair means?

Any form of unfair means is treated as a serious academic offence and action may be taken under the Discipline Regulations. For a student registered on a professionally accredited programme of study, action may also be taken under the Fitness to Practise Regulations. Where unfair means is found to have been used, the University may impose penalties ranging from awarding no grade for the piece of work or failure in a PhD examination through to expulsion from the University in extremely serious cases.

Detection of Unfair Means

The University subscribes to a national plagiarism detection service which helps academic staff identify the original source of material submitted by students. This means that academic staff have access to specialist software that searches a database of reference material gathered from professional publications, student essay websites and other work submitted by students. It is also a resource which can help tutors and supervisors to advise students on ways of improving their referencing techniques. Your work is likely to be submitted to this service.

For further information, see http://www.shef.ac.uk/ssid/charter/guidance_taught.html and http://www.shef.ac.uk/ssid/procedures/grid.html#discipline

Failure to Comply with Assessment Requirements

Failure to attend an examination without adequate reason will result in an **NC** ('Not Completed') grade, and you cannot progress until you have resat this module.

If you are ill you must

(i) obtain a **medical note** signed by a **medical practitioner** (and only those signed by the University Health Service will definitely be accepted);

(ii) you must also complete a 'Special Circumstances Form' to explain your absence, and hand it in at SoMaS Reception in Room G12 of the Hicks Building.

Excuses such as misreading the timetable or oversleeping are **not** acceptable as reasons for absence.

Any student who misses an exam should avoid seeing or talking about the exam and report to SoMaS Reception as soon as possible.

It is recommended that students with ongoing medical or personal circumstances complete a special circumstances form each semester to ensure that consideration of their condition is not overlooked.

Failure to hand in assessed coursework on time without good reason will result in the imposition of a penalty in accordance with the University's Penalties Policy. Late submission of a major piece of assessed coursework, such as a project dissertation, will result in the deduction of 5% of the total mark awarded for each of the first 5 'University Working Days' by which the submission is late; work submitted even later than that will receive a mark of 0. For pieces of assessed coursework that contribute only a small percentage of the overall assessment, the Faculty of Science has given the School approval to operate a policy of 'zero tolerance', under which any late submission receives a mark of 0.

Module leaders have the power to award dispensations in cases where the lateness was caused by certifiable medical problems or severe personal circumstances; requests for such dispensations should be made as soon as the problem is known, in writing or by e-mail to the module leader; students making such requests must also complete a ‘Special Circumstances Form’ and hand it in at SoMaS Reception (G12).

Statement on Assessment Criteria

Typical examinations in SoMaS involve several questions each of which will have components of at least some of the following types: (i) explanation of theory developed in the module; (ii) standard problems solvable using methods seen in the module; (iii) more difficult unseen problems requiring knowledge of the module but also requiring some original thought. Students’ scripts are assessed using a strict and detailed marking scheme, usually based on method and accuracy marks. The primary criterion is correctness, whether it be of calculation, method or explanation.

This produces a set of ‘raw marks’ which is then scaled, using the judgement of the examiner, to the University’s 100-point reporting scale, which correspond to degree classifications using the following rule:

70–100	:	Class I
60–69	:	Class II(i)
50–59	:	Class II(ii)
45–49	:	Class III
40–44	:	Pass.

If an examiner feels that a mark of 30% on the exam is deserving of a pass, then 30% will be scaled to 40 on the University’s scale; there are similar points at each of the classification boundaries.

The scaling is subjected to a central School scrutiny process involving, after Semester 1 of Year 1, the past record of each student who is registered for the module and for whom there are no abnormal circumstances. For each such student, a target mark is calculated and the average mark for the module is required to be within a specified distance, depending on the class size, of the average target mark.

Examination papers, including the past papers to which the students have access in advance, carry the distribution of marks between parts of questions.

The internal checker for each examination paper and the appropriate External Examiner are provided with copies of the module’s objectives/learning outcomes, and these are also distributed to students. The internal checker is asked to complete a form indicating how well the paper assesses the learning outcomes.

The School operates a scheme whereby marking is checked for accuracy and adherence to the marking scheme. Each semester, the Director of Teaching makes a selection of modules, with a view to comprehensive coverage of all staff involved in marking, and asks a second marker to remark a random selection of scripts, following the detailed markscheme, and to report on the outcome. On each paper at Level 2 and above, selected scripts, usually from the borderbands between classifications, are sent to the appropriate External Examiner. Before the Final Year Examination Board Meeting, all final year scripts of borderband candidates are looked at by the External Examiners.

All examination marking and all discussion at formal Examination Board Meetings is conducted anonymously, that is, students are identified only by their registration numbers.

Students have the right to see their examination scripts after they are marked; this generally takes place around Week 3 of Semester 1 (for the previous session's June exams) and Week 6 of Semester 2 (for the January exams).

Award of Degrees

In order to qualify for the award of a degree, students have to obtain a specified number of credits. Also, the 'level' of the credits is important. In what follows, 'Level 3 modules' refers to courses MAS3**, normally (but not always) taken during Level 3, and 'Level 4 modules' refers to courses MAS4**, normally (but not always) taken during Level 4.

In order to be awarded an **honours degree of BSc**, you must obtain at least **200 credits**, of which at least **90 must be of Level 3 modules**, out of the overall **240 credits** possible on the second and third years combined.

This is a minimum requirement below which you cannot obtain an honours BSc degree: the granting of a pass degree (that is, without honours) to a student with less than 200 credits (or with less than 90 credits of Level 3 modules) is always at the discretion of the examiners, and requires the specific concurrence of the External Examiners. A minimum of 180 credits is required for this.

Candidates for a BSc degree who have completed, and submitted themselves for assessment on, 120 credits at each of Levels 2 and 3 but have not been recommended for the award of a degree may enter for a subsequent examination for each failed module on one further occasion (subject to a maximum of two opportunities to sit any given module), but will only be eligible for the award of a pass degree.

In order to be awarded an **honours degree of MMath**, you must take **120 credits** of Level 4 modules across Levels 3 and 4. You must obtain at least **320 credits**, of which at least **90 must be Level 4 modules**, out of the overall **360 credits** possible on the second, third and fourth years combined, provided the Examiners recommend a class II(ii) degree or above. (Classification of honours degrees is discussed in the next subsection.) Candidates whom the Examiners would place in Class III will be recommended for the award of a BSc degree with honours; candidates whom the Examiners deem to be worthy of a pass shall be recommended for the award of a BSc pass degree.

In particular, **in order to be awarded an MMath degree, you must pass at least 90 credits of Level 4 modules.**

Candidates for an MMath degree who have completed, and submitted themselves for assessment on, 120 credits at each of Levels 2, 3 and 4 but have not been recommended for the award of a degree may enter for a subsequent examination for each failed Level 4 module on one further occasion (subject to a maximum of two opportunities to sit any given module), but will only be eligible for the award of a BSc pass degree.

Classification of Honours Degrees

Under the current Regulations, for each module you complete you will be awarded a mark on the University 100-point scale. This subsection describes the way that these marks contribute to the final degree classification.

The full details are available from the the University's General Regulations for First Degrees at `http://calendar.dept.shef.ac.uk/calendar/06d_gen_regs_for_first_degrees.pdf`. Here are the main points.

All your module marks (including any for which the mark is 40 or below) for years 2, 3 (and 4 if appropriate) are averaged, but Level 2 marks are given half the weight of Level 3 and Level 4 marks.[2] Then two calculations are made.

Calculation 1 (the weighted mean grade) is made in accordance with the following principles:

- where a candidate's weighted mean grade is of a value indicated in the first column, the outcome of Calculation 1 shall be the corresponding class indicated in the second column

69.5 or higher	:	Class I
59.5 or higher	:	Class II(i)
49.5 or higher	:	Class II(ii)
44.5 or higher	:	Class III
39.5 or higher	:	Pass;

- where a candidate's weighted mean grade falls within the band indicated in the first column, the outcome of Calculation 1 shall be the borderline to the corresponding class indicated in the second column

68.0–69.4	:	Class I
58.0–59.4	:	Class II(i)
48.0–49.4	:	Class II(ii)
44.0–44.4	:	Class III
38.0–39.4	:	Pass.

Calculation 2 (the distribution of grades) is made in accordance with the following principles:

- where the best half of a candidate's weighted grades are of a value indicated in the first column, the outcome of Calculation 2 shall be the corresponding class indicated in the second column

69.5 or higher	:	Class I
59.5 or higher	:	Class II(i)
49.5 or higher	:	Class II(ii)
44.5 or higher	:	Class III
39.5 or higher	:	Pass;

[2] For students on the MMath Mathematics with Study in Europe, Australia, North America or Year Abroad programmes or the MMath Mathematics with French/German/Spanish Language programmes, Level 2 and Level 3 marks are given half the weight given to Level 4 marks. (The year abroad does not count towards the classification for the BSc Mathematics with Study in Europe degree, although a pass in the year abroad is required to remain on the programme.)

- where the best five twelfths of a candidate's weighted grades are of a value indicated in the first column, the outcome of Calculation 2 shall be the borderline to the corresponding class indicated in the second column above.

In recommending the **class of degree** to be awarded to each candidate, the Examiners shall take into account the outcomes of Calculations 1 and 2 in accordance with the following principles:

- where one Calculation places the candidate in one class and the other Calculation places the candidate in either the same class or the borderline to the same class, the candidate shall normally be recommended for the award of a degree of that class;
- where one Calculation places the candidate in one class, and the other Calculation places the candidate in the borderline to the class immediately above, the candidate shall normally be recommended for the award of a degree of the lower class;
- where one Calculation places the candidate in one class, and the other Calculation places the candidate in the class immediately below, the candidate shall be considered as being in the borderline to the higher class, and the class of the degree to be recommended by the Examiners shall normally correspond to the class indicated by the weighted mean of the grades at the final Level of study;
- where both Calculations place the candidate in the same borderline, the class of the degree to be recommended by the Examiners shall normally correspond to the class indicated by the weighted mean of the grades at the final Level of study;
- where one Calculation places the candidate in one class, or borderline to a class, and the other Calculation places the candidate in another class, or borderline to a class, neither immediately above nor below, the Examiners shall recommend the classification which, having regard to all the evidence before them, best reflects the overall performance of the candidate.

Note that the Examiners are free to vary from the formal rules for any candidate where there is strong evidence to support such a decision. In consideration of such evidence, the Examiners will seek guidance from the School's External Examiners. Also, if a candidate is awarded a classified degree (I, II(i), II(ii), or III) then the degree is an **honours** degree irrespective of whether the candidate has any failed modules.

There is a University appeals procedure, full details of which are displayed on the student notice boards listed later in this handbook. They may be also found on the web at `http://www.shef.ac.uk/ssid/procedures/grid.html`, or as described at the end of the section entitled 'Where else to find Information' on p.19.

Transcripts

After graduation, you may wish to obtain a transcript of your detailed module results to show prospective employers. For details see `http://www.shef.ac.uk/ssid/transcript`. Note that single copies are free for recent graduates (up to 12 months after graduation), but cost £20 thereafter.

Prizes

The following prizes may be awarded to Level 3 and Level 4 students.

David Burley Prize in Applied Mathematics

This prize was established in 2000 and named in honour of Dr D M Burley, former Head of the Department of Applied Mathematics and a member of staff from 1960 to 1995.

1. Frequency of award: One annually.

2. Value of prize: £100.

3. Eligible candidates: Students taking a significant proportion of Level 3 or 4 units in Applied Mathematics.

4. Assessor: The Head of School.

5. Criteria for assessment: The best overall performance in Applied Mathematics (not necessarily the highest marks in any examination).

Sir Edward Collingwood Prizes in Probability and Statistics

This prize was founded in 1970 by the Applied Probability Trust in memory of Sir Edward Collingwood, who was Chairman of the Trust from its inception in 1963 to 1970, and President of the London Mathematical Society in 1970.

1. Frequency of award: Two annually.

2. Value of prizes: £50 each.

3. Eligible candidates: (a) Students who have completed two years of a programme of study containing, in the opinion of the Head of School, a substantial amount of Probability and/or Statistics. (b) Students who are taking the Final Examination for the programmes of study in Mathematics and Statistics.

4. Assessor: The Head of School.

5. Criteria for assessment: The best overall performance in Probability and/or Statistics (not necessarily the highest marks in any examination).

T M Flett Prizes in Pure Mathematics

These prizes were founded in 1977 from subscriptions in memory of Professor T M Flett, member of staff of the Department of Pure Mathematics from 1967 to 1976.

1. Frequency of award: Two annually.

2. Value of prizes: £75

3. Eligible candidates: Students who are taking the Final Examination for a programme of study in which the Pure Mathematics component constitutes at least one half of the Level 3 course.

4. Assessor: The Head of School.

5. Criteria for assessment: The appropriate examination considered in conjunction with coursework carried out during the year.

Wendy Wright Prize in Probability and Statistics

This prize was endowed by Miss Hilda Davies on her retirement from the Department of Probability and Statistics in 1979 and named at her request in memory of Mrs Wendy M Wright, a graduate of the University and former Research Assistant in Statistics.

1. Frequency of award: One annually.

2. Value of prize: £100.

3. Eligible candidates: Final year undergraduates on a programme of study involving a substantial number of Statistics courses.

4. Assessor: The Head of School.

5. Criteria for assessment: Performance in Level 3 or Level 4 Practical and Applied project work in Probability and Statistics.

The Institute of Mathematics and its Applications Prize

This prize was established by the Institute of Mathematics and its Applications (IMA). The IMA is the UK's learned and professional society for mathematicians and its applications. It promotes mathematics research, education and careers, and the use of mathematics in business, industry and commerce.

1. Frequency of award: Two annually.

2. Value of prize: One year's membership of the Institute of Mathematics and its Applications.

3. Eligible candidates: Final year students in the School of Mathematics and Statistics.

4. Assessor: The Head of School.

5. Criteria for assessment: Outstanding performance in the final year.

4 Help, Guidance and Information

Personal Tutors

The personal tutorial system operates for the rest of your course. The present arrangements are that students normally continue with the same personal tutor as in the second year. If you envisage any problem with this then please see the Senior Tutor; it is possible for you to request a change of personal tutor. Third- and fourth-year students should go to see their tutors each semester, at the beginning of Semester 1 and in Semester 2 when the Semester 1 examination results have been published. However, questions about work concerning particular modules should generally be put to the lecturers concerned. All students are encouraged to keep in touch with their tutors who are then in a good position to act as referees when the time for job applications arrives.

There is in addition a Tutor for Women Students, who is available to discuss problems of a more personal or confidential nature. The Senior Tutor acts as a Tutor for Men Students. There is also a Tutor for Mature Students, who acts as personal tutor to a substantial proportion of the mature students in the School.

If you have any difficulty in contacting your personal tutor, or he or she is unable to solve any problem or answer any query, then you can approach the Senior Tutor or other designated staff members (see the list at http://www.maths.dept.shef.ac.uk/maths/contact.php).

Please make sure that your home address is correct on MUSE before you leave at the end of Semester 2. You will have the same University e-mail address in 2012–2013 as this year. You should make sure your tutor knows your e-mail address, and you should check for e-mail messages when you return to Sheffield in September.

Student Advice Centre, SSiD, Counselling Service, and University Health Service

The Student Advice Centre and Student Services Information Desk (SSiD) provide assistance on a wide range of problems. Specifically, they provide advice on housing, finance, problems about harassment, and help to international students; they also help with academic matters. The Counselling Service and the University Health Service are also there to help you; strict confidence is always observed.

Nightline

Nightline is the University of Sheffield's confidential listening and information telephone service. It is run by trained student volunteers, and operates from 8.00pm until 8.00am every night during term time. It offers students everything from the phone number of a twenty-four hour taxi company, to examination dates, times and locations, and information about many issues that can be encountered within student life. It provides a vital support network for all students, so whatever you need to say, Nightline is listening, and the service can be called free from phones in halls of residence. If you think you would like to volunteer for Nightline, contact nightline@shef.ac.uk for more information.

The Careers Service

The Careers Service (whose web page is at http://www.shef.ac.uk/careers/) offers an excellent provision, backed up with a wealth of experience, to help students decide on a career and to find employment after graduation. You could also talk to the School's Careers Liaison Officer, listed on http://www.maths.dept.shef.ac.uk/maths/contact.php.

Making good career decisions will involve you in thinking about your qualities and inclinations. The Careers Service provide resources on career planning, CV writing, job seeking, interview skills, and much else. They also organise an extensive programme of careers events, which provide valuable opportunities to meet prospective graduate employers, and find out what skills they are looking for. Similar skills sessions are also offered by the University's Enterprise Zone (http://enterprise.shef.ac.uk/).

Graduates from our degrees go on to a wide range of careers. Many go on to careers for which a mathematical degree is very important; others go on to careers where degree-level education is important, though not necessarily using mathematical skills. Mathematics graduates have a strong range of transferable skills, including excellent numeracy and analytical problem solving skills. Your degrees often make use of computer packages, and these IT skills are often adapatable to IT requirements of employers. Employers also value highly the ability to communicate mathematical ideas to lay audiences.

A number of our graduates have interest in teaching; the Postgraduate Certificate of Education (PGCE) is a common qualification, and is offered in mathematics by the University of Sheffield (and many other universities). It is administered by the Department of Education, and you should contact them for further information. Other graduates go on to more specialised postgraduate qualifications, including our own MSc in Statistics (and the School is implementing an MSc in Mathematics from 2012–13).

Students are strongly advised to make use of the wide range of resources that the Careers Service has to offer. The Careers Service is located at 388 Glossop Road, on the corner of Glossop Road and Durham Road. There is also a Student Jobshop in the Student Union.

The Staff-Student Forum

Nominations for the Staff-Student Forum will be requested at the start of the Autumn Semester. Please think about the possibility of standing for election to the Forum. It will give you an opportunity to have a role in the organisation and management of factors influencing student life in the School of Mathematics and Statistics. The Forum usually meets twice a semester. A number of student members serve as student representatives on the School Teaching Committee, and minutes from the Staff-Student Forum are considered by the School Teaching Committee.

Issues may be raised with forum members at any time; a list of members and how to contact them is on the Staff-Student Forum noticeboard, on G Floor, opposite SoMaS Reception G12. You can find more information from the web pages at `http://www.maths-ssc.group.shef.ac.uk/` and can also give feedback, anonymously if desired, via the webpage `http://www.maths-ssc.group.shef.ac.uk/shef-only/feedback.html`.

There are further opportunities for student representation within the Faculty of Science.

Voluntary work

The University encourages its students to consider undertaking some voluntary work. The text below has been provided by the Manager of SheffieldVolunteering, which is based in the Students' Union.

> 'Volunteering is a great way to get to know the city and its people. You can gain career-related experience or simply volunteer for something that appeals.
>
> 'You can do something just for a day or give a couple of hours each week or fortnight. It's really flexible and you won't be asked to help during exams or vacations.

‘Choose from over 100 options — in student neighbourhoods and the city centre. Alternatively, we can help you to develop your own volunteer project involving other students and benefiting the wider community.

‘Our staff can help you to find something that’s right for you. Training and out-of-pocket expenses are provided too.

‘Set yourself apart. Visit http://www.sheffieldvolunteering.info or see us in the Source (Level 3, Union Building).’

Where else to find Information

Lists for personal tutors, timetables, draft examination timetables, and examination results will be displayed in the Hicks Building on:

(i) the notice boards between Lecture Theatres 6 and 7 on E Floor;
(ii) the notice boards outside the Computing Room G25 on G Floor;
(iii) the notice boards near SoMaS Reception G12 on G Floor.

Urgent messages will be displayed in the Entrance Foyer, or sent by e-mail. **Please check notice boards and your e-mail regularly.**

Office-holders in the School and Departments

A list of the members of staff who currently hold various Offices in the School of Mathematics and Statistics and its departments can be found at http://www.maths.dept.shef.ac.uk/maths/contact.php.

A list of the members of staff who are currently authorized to sign Add-Drop and Change-of-Status forms can be found at http://www.maths.dept.shef.ac.uk/maths/who_signs.php.

5 Health and Safety

Smoking

Students are reminded that smoking is prohibited on all University premises – this includes the area under the canopy at the main entrance to the Hicks Building. In addition, we request that you refrain from smoking on the steps immediately outside the Hicks Building.

First Aid

First Aid boxes are available in SoMaS Reception (Room G12), the Porters Lodge (Hicks Foyer, D Floor), and the Physics Departmental Office (Room E34). Lists of qualified first-aiders can be found outside, or near to, these locations.

Fire Alarm

If the fire alarm sounds in the Hicks Building, please proceed calmly to the nearest exit and assemble in the designated area (on the concourse, underneath the road bridge). **Do not** use lifts. **Do not** re-enter the building until you have been told that it is safe to do so by a fire officer. Note that the alarm is tested for about 30 seconds on Mondays at about 9.50.

6 Information on Mathematics and Statistics Courses

The Aims and Learning Outcomes of the Degree Programmes

The mission of the School of Mathematics and Statistics is

- to conduct high quality research in mathematics and statistics;

- to provide an excellent and inspiring education for students;
- to support, to promote and to increase the impact of our disciplines;
- to be a research-led school that maintains high standards in all activities.

Aims

For all the School's undergraduate programmes, the aims are:

- to provide an intellectual environment conducive to learning;
- to prepare students for careers which use their mathematical and/or statistical training;
- to provide teaching which is informed and inspired by the research and scholarship of staff;
- to provide students with assessments of their achievements over a range of mathematical and statistical skills, and to identify and support academic excellence.

There are also additional aims for particular programmes.

- In all its first degrees the School aims to provide programmes with internal choice to accommodate the diversity of students' interests and abilities.
- - In its single honours degrees, the School aims to provide a programme in which students may choose either to specialise in one mathematical discipline (Pure Mathematics, Applied Mathematics,Probability and Statistics) or to follow a more balanced programme incorporating two or all three of these disciplines.
  - In its dual degree programmes, the School aims to provide an appropriate Mathematics component.
- In all MMath programmes, the School aims to prepare students for progression to a research degree in one of the three mathematical disciplines or for careers in which the use of Mathematics is central.
- In its single honours programmes with Study in Europe and its programmes with French, German or Spanish Language, the School aims to offer students the opportunity to study Mathematics and Statistics in another European country.
- The MMath programmes with a named language also aim to provide language instruction beyond that needed to study Mathematics and Statistics abroad, giving students the opportunity to acquire all-round fluency in the language.
- In its programmes with Study in Australia or North America, or with Year Abroad, the School aims to give students the opportunity to benefit from the experience of studying in a different educational culture.

Learning Outcomes

In line with the requirements of HEFCE's Teaching Quality Information initiative, the University has introduced programme specifications for undergraduate and postgraduate taught programmes to provide clear and explicit information for existing and potential students so that they can make informed choices about their studies. In addition to the Aims of the School's undergraduate programmes listed above, there are Learning Outcomes that students are expected to have developed upon successful completion of the programme and achievement of which will usually have been demonstrated via the assessment process. These differ for each degree programme offered; students may consult the latest versions at http://www.shef.ac.uk/calendar/progspec.

Module Questionnaires

Students are strongly encouraged to complete Module Questionnaires for every module they take. These questionnaires are now administered electronically, and instructions on how to complete the questionnaires will be issued every semester.

These questionnaires are important to the School. This is your formal opportunity to give your view on aspects of the course – you can also give comments informally via your Personal Tutor, the Staff-Student Forum, to the lecturer directly, etc., and this is also appreciated.

We are always keen to hear ways to improve our teaching and your learning experience. Considered and thoughtful feedback can provide an extremely helpful input into the School's teaching.

In the same way that receiving a piece of marked work with just a mark out of 10 is not as useful as comments showing how you can improve, we would like to encourage you to be specific and constructive in your questionnaire responses. Reasoned and constructive comments you make on modules can be very helpful, both to the individual lecturer concerned, and to the School, so that we can spread good practice.

Lecturers are human beings with feelings, just like students, and if you feel the need to be critical of aspects of a module, please try to offer criticism in a sensitive way. It is always good to read positive comments as well as critical ones, so if you feel that a lecturer is doing something well, please let them know!

The questionnaires and comments are considered by members of the Staff-Student Forum, and by the School's Teaching Committee. Comments have led to changes in School procedures, as well as to alterations in course content and practice of lecturers. They also form a valuable input to the annual appraisal of staff.

Recent questionnaire results are also circulated at the time of online module choice; in this way, your responses can help those at lower levels in making their module decisions.

The numerical data is published on the Staff-Student Forum webpage, as well as on the Staff-Student Forum noticeboard; individual comments are seen by Staff-Student Forum members and individual lecturers.

Your considered feedback plays a valuable part in improving our teaching.

Degree Regulations

Full details of these Regulations are available on the web, as described in the section entitled 'Official University Information for Students on the Web' on p.19. However, at the time of publication of this handbook, the Regulations on the web may be for 2011–2012 rather than 2012–2013. In particular, their lists of modules may reflect availability in 2011–2012 rather than in 2012–2013.

You are reminded that to be eligible to enter Level 3 of the degree of MMath you must normally have obtained 120 credits at Level 2 with an average of at least 59.5. Candidates for the MMath Mathematics with Study in Europe degree who fail to achieve the required average in Level 2 may be able to transfer to the BSc Mathematics with Study in Europe rather than the ordinary BSc. Anyone considering this should consult Dr Stillman.

In what follows, the term 'Level 3 module' refers to the modules listed later in this booklet which have codes MAS3** and the term 'Level 4 module' refers to those which have codes MAS4**. Broadly speaking, you would expect to do Level 3 modules in your third year and Level 4 modules (if you are taking the MMath) in your fourth year; but exceptions are allowed, as detailed below.

Specific degree regulations

BSc Mathematics Year 3, BSc Mathematics with Study in Europe Year 4

You must take modules to the value of **120 credits** from the Level 3 modules listed in this handbook, but this may be varied, as follows.

(a) BSc Mathematics students may replace **up to 30 credits** of these Level 3 modules by Level 4 modules from the list

MAS423	Advanced Operations Research
MAS424	Differential Equations (Advanced)
MAS438	Fields
MAS441	Optics and Symplectic Geometry
MAS442	Galois Theory
MAS452	Stochastic Processes and Finance [20 credits]
MAS465	Multivariate Data Analysis
MAS472	Computational Inference

These options are, however, subject to the consent of the School (which is given when your module choice form is approved). In general, to be permitted to take these modules you will need to have scored an average of at least 60 at Level 2 (or in the Level 2 January examinations, if only those results are available). You will also have to obtain satisfactory grades in the necessary prerequisite modules.

(b) In addition to (a), all students may replace **up to 20 credits** of Level 3 modules by unrestricted modules (see the section on unrestricted modules on p.5 for details of the conditions that apply).

You **must not** choose modules to the value of more than **70 credits** in any semester. (You are advised to avoid taking 70 credits in the second semester.)

BSc Financial Mathematics Year 3

Candidates for this degree programme must take **all modules** in the list

MAS331	Metric Spaces	10 credits
MAS362	Financial Mathematics	10 credits
MAS452	Stochastic Processes and Finance	20 credits,

modules to the value of **40 credits** from the list

MAS301	Group Project	10 credits
MAS312	Classical Control	10 credits
MAS322	Operations Research	10 credits
MAS330	Topics in Number Theory	10 credits
MAS332	Complex Analysis	10 credits
MAS343	History of Mathematics	10 credits
MAS345	Codes and Cryptography	10 credits
MAS350	Measure and Probability	10 credits
MAS363	Linear Models	10 credits
MAS364	Bayesian Statistics	10 credits
MAS370	Sampling Theory and Design of Experiments	10 credits
MAS371	Applied Probability	10 credits
MAS372	Time Series	10 credits
MAS377	Mathematical Biology	10 credits
MAS472	Computational Inference	10 credits,

and modules to the value of **40 credits** from the list

ECN357	Modern Finance	20 credits
MGT321	Corporate Finance	20 credits
MGT375	Financial Derivatives	20 credits.

MMath Mathematics with Study in Europe or with Year Abroad, Year 3

You will spend your Level 3 year studying at an overseas university. However, you should try to ensure that in 2012–2013, at that overseas university, you acquire the prerequisites for the Level 4 courses you want to take in 2013–2014. See the warning on choice of modules on p.4. You are strongly advised to consult the member of staff with special responsibility for your programme (see `http://maths.dept.shef.ac.uk/maths/contact.php` for the current list) about this aspect.

MMath Mathematics with French/German/Spanish Language Year 3

You will spend your Level 3 year studying at an overseas university. In your fourth year, back in Sheffield, you will be required to take 80 credits of SoMaS Level 4 modules, and the compulsory project modules provide 40 of these credits. Further details of these are given below. You should plan carefully so that in 2012–2013 you acquire the prerequisites for the Level 4 courses you want to take in 2013–2014. See the warning on choice of modules on p.4. You are strongly advised to consult the programme leader for advice (see http://maths.dept.shef.ac.uk/maths/contact.php for the current list).

MMath Mathematics Years 3 and 4

Across Levels 3 and 4, you must take modules to the value of **120 credits** from Level 4 modules listed on the following pages. It is expected that you would normally take 120 credits of Level 4 modules at Level 4; however, you may use your allowance of unrestricted modules at Level 3 to take up to 20 credits of Level 4 modules; you may then take Level 3 modules at Level 4 as long as you take at least 120 credits of Level 4 modules in total.

In order to progress to Level 4, University regulations require you to have been awarded 120 credits at Level 3 and have obtained a weighted mean grade at Level 3 of not less than 54.5, but see the warning on p.7; progression is not automatic.

You should plan carefully so that in 2012–2013 you acquire the prerequisites for the Level 4 courses you want to take in 2013–2014. See the warning on choice of modules on p.4.

MMath Mathematics Year 4, MMath Mathematics with Study in Europe Year 4, MMath Mathematics with Year Abroad Year 4

Students must choose 120 credits of mathematics modules, except that students taking the MMath Mathematics with Study in Europe degree in their fourth year may replace up to 20 credits with language modules at the appropriate level.

At Level 4, your choice of Level 4 modules **must include 40 credits of project modules**. These consist of MAS400 and MAS406. Further details of these are given below.

Across Levels 3 and 4, you need to take 120 credits of Level 4 modules (for this purpose, language courses offered to students on the MMath Mathematics with Study in Europe degree may count as Level 4, even though their code is MLT3∗∗).

You **must not** choose modules to the value of more than **70 credits** in any semester. (You are advised to avoid taking 70 credits in the second semester.)

MMath Mathematics with French/German/Spanish Language Year 4

In your fourth year, you must take modules to the value of **40 credits** in the appropriate foreign language and modules to the value of **80 credits** from the Level 4 modules listed in this handbook. You do not the option of taking an unrestricted module in your fourth year.

Furthermore, your choice of Level 4 modules **must include 40 credits of project modules**. These consist of MAS400 and MAS406. Further details of these are given below.

The remaining 40 credits you are permitted to take must be taken from: MAS423,

MAS430, MAS435, MAS436, MAS438, MAS439, MAS441, MAS442, MAS452, MAS461, MAS462, MAS463, MAS464, MAS465, MAS472, MAS473.

The Level 4 Project

The Level 4 project is available only to MMath Mathematics, MMath Mathematics with Study in Europe, MMath Mathematics with Year Abroad, and MMath Mathematics with French, German or Spanish Language students, in their fourth year: no part of it may be taken as an unrestricted module by third-year students.

The project has two parts.

(a) MAS400 Project Presentation in Mathematics and Statistics (Autumn Semester, 10 credits)

This 10-credit module provides training and practice in both written and oral presentation of mathematics and statistics. The course focuses on the use of LaTeX, the international standard computer software for the presentation of mathematics, and on the coherent and accurate presentation of mathematics.

Aims: to
(1) train students in the use of appropriate software for the presentation of mathematics,
(2) guide students on the need for accuracy and coherence in presentations,
(3) develop communication skills.

The spine of the course is a sequence of five laboratory sessions which are designed to introduce you to the appropriate software. These are supplemented by three lectures on written and oral presentation skills.

Your assessment will be based on several pieces of written work relevant to your project area and on a fifteen-minute oral presentation. These will be assessed using a marking scheme explicitly addressing the expected learning outcomes:
(1) skill in the use of appropriate computer software in presenting mathematics,
(2) ability to present an argument precisely and coherently, and
(3) ability to communicate ideas effectively.

(b) MAS406 (all year, 30 credits)

This is the main module in the School's project provision at Level 4 and introduces you to the experience of researching and presenting an advanced topic in your chosen subject area under the guidance of a research-active supervisor.

Aims: to give students experience of, and training in, research and presentation of an advanced mathematical topic. In particular:
(1) to support the development of independent study skills,
(2) to support the acquisition of communication and presentation skills,
(3) to provide an opportunity for the student to experience research,
(4) to give the opportunity to study a specialist topic of attraction to the student.

You will choose a topic from a list made available in advance of the session. You will then have meetings with your supervisor, following a recommended schedule, at which you will be given guidance on appropriate resources, such as library and internet, and feedback on your progress. Training in the use of appropriate software for presentation is provided in the corequisite module MAS400 and more specialist advice and feedback, pertaining to the individual project topic, will be given by your supervisor.

In the autumn semester, the students will begin to understand the topic of the project, and will write a draft report of part of the project for feedback purposes.

This report is expected to be a preliminary report on a substantial project, to be continued in the spring semester. However, in exceptional circumstances, the student might be permitted to switch to a different topic in the spring semester.

The final report at the end of the spring semester is expected to be more substantial, at around 30–40 pages.

The module will be assessed on the basis of the report, and reference to expected learning outcomes:
(1) specialist knowledge of an advanced mathematical topic,
(2) ability to research an advanced mathematical topic,
(3) ability to present an accurate and coherent report on a mathematical topic,
(4) general presentational skills including correct usage of language and grammar,
(5) ability to use library and internet resources effectively,
(6) skill in using appropriate software for the presentation of mathematics, the most substantial component being for mathematical accuracy.

Assessment of reports will be by two members of staff and will be subject to moderation by a project coordinator. Both your report and a report by the assessors will be made available to the External Examiner. The student will give a presentation on the spring semester material, and this will contribute to the assessment of MAS406.

With permission of the Director of Teaching, the 30-credit module MAS406 may be replaced by MAS407, a 40-credit module, with a larger spring semester component. Permission to take this larger project module is likely to be granted only in exceptional circumstances.

Other Level 3/4 modules

Most of the remainder of this document contains descriptions of the other modules offered by SoMaS at Levels 3 and 4; the final section gives a grid summarising the provisional schedule and timetable for these modules.

MAS300: Undergraduate Ambassadors Scheme in Mathematics

Semester 2, but see the Outline Syllabus below   10 credits

Prerequisites:	Agreement of module co-ordinators
Prerequisite for:	
Cannot be taken with:	

Description

MAS300 is a course which involves no formal lectures but which, instead, places students in the classroom environment of the Mathematics Departments of local secondary schools. The time spent within the allocated school is highly structured to ensure the desired outcomes of the course.

Aims

- To develop students' confidence in their ability to act independently in the execution of complex and important tasks;
- To develop the complex skills required to communicate difficult subjects in a variety of ways to people of widely varying abilities;
- To develop the personal skills required to engage the attention of people as individuals and of people in groups;
- To learn the specific skills required to develop projects and teaching methods appropriate to the age group of pupils under tuition;
- To inspire a new generation of prospective undergraduates by providing positive role models in the classroom;
- To stimulate pupils by conveying the excitement of their subject and showing the long-term benefits of studying;
- To provide additional classroom support for teachers in the form of an assistant who can work with pupils at any point on the ability spectrum;
- To provide a short, but direct, experience of teaching to those interested in pursuing it as a career.

Outline syllabus

A competitive interview system will be used to select students for the module early in the Autumn semester, and to match each successful applicant with an appropriate school and a specific teacher in the local area. An initial day of training – held before Christmas – will provide the students with an introduction to working and conduct in the school environment. Each student selected will be required to visit the school they will be working in before commencement of the unit, usually before Christmas. The students will be required to spend half a day (approximately 4 hours) each week in the school for ten weeks of the second semester. It is intended that there will be no formal lectures associated with the unit, and that wherever appropriate the students' own ideas will increasingly define the nature of their teaching activities as they become more experienced. However, there will be supporting tutorials which will provide an opportunity for students to share their experiences with their contemporaries and the module coordinators. The teachers will act as the main source of guidance but, in addition, students will be able to discuss their progress with the module coordinators whenever necessary.

Module Format

Lectures	0	Tutorials	10	Practicals	10

Recommended books

- There are no recommended books for this course.

Assessment

A weekly diary [15%]; End-of-module written report [30%]; A written account of your special project [20%]; An oral presentation [20%]; Assessment by the teacher moderated by module coordinator [15%].

MAS301: Group Project

Semester 1 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS202 (Advanced Calculus)
Prerequisite for:	
Cannot be taken with:	MAS360 (Practical and Applied Statistics)

Description

This unit will provide students with opportunities to improve their transferable skills by working in groups of (normally) four students to investigate a mathematical project topic. It is suggested that students register for MAS301 in pre-formed groups, although this is not obligatory. With the aid of the Library and the internet each group will produce a (single) written account of the group's investigations into the topic, and contribute to an oral presentation of their work. Topics will be proposed by members of staff, but groups may propose their own. The module Coordinator will provide guidance about working in groups, and on appropriate techniques for the written and oral presentation of mathematical topics.

Aims

- To provide opportunities for students to improve their transferable skills
- To provide an opportunity for students to gain experience of working in small groups
- To provide an opportunity for students to develop their information retrieval skills
- To provide an opportunity for students to improve their ability to construct a joint, written report that demonstrates their understanding of an advanced mathematical topic
- To provide an opportunity for students to enhance their skills in the preparation and delivery of oral presentations

Outline syllabus

There is no recorded outline syllabus for this module.

- There are no recommended books for this course.

Assessment

Written group project dissertation [65%]. Oral group presentation [25%]. Individual's contribution to work of group [10%].

MAS310: Continuum Mechanics

Semester 1 10 credits

Prerequisites:	MAS112 (Vectors and Mechanics); MAS270 (Vectors and Fluids)
Prerequisite for:	MAS320 (Fluid Dynamics I), MAS411 (Topics in Advanced Fluid Mechanics)
Cannot be taken with:	

Description

Continuum mechanics is concerned with the mechanical behaviour of solids and fluids which change their shape when forces are applied. For example, rubber extends when pulled but behaves elastically returning to its original shape when the forces are removed. Water starts to move when the external pressure is applied. This module aims to introduce the basic kinematic and mechanical ideas needed to model deformable materials and fluids mathematically. They are needed to develop theories which describe elastic solids and fluids like water. In this course, a theory for solids which behave elastically under small deformations is developed. This theory is also used in seismology to discuss wave propagation in the Earth. An introduction in theory of ideal and viscous, incompressible and compressible fluids is given. The theory is used to solve simple problems. In particular, the propagation of sound waves in the air is studied.

Aims

- To introduce the basic kinematic and mechanical ideas needed to model deformable solids and fluids.
- To introduce and illustrate the theory of classical elasticity with simple example of exact solutions and applications to seismology.
- To introduce the theory of ideal and viscous, incompressible and compressible fluids, and apply it to solve simple problems.

Outline syllabus

- Mathematical preliminaries: Scalar and vector fields. Tensors in Euclidean space. Transformation of Cartesian coordinates. Transformation of Cartesian components of vectors and tensors. Differentiation of vectors and tensors in Cartesian and curvilinear coordinates.
- Kinematics of continuum: Lagrangian and Eulerian description of continuum motion. Velocity and acceleration. Strain tensor. Rate of strain tensor. Mass conservation equation.
- Dynamics of continuum: Stress tensor and its main properties. Momentum equation. Boundary conditions at rigid and free surfaces.
- Simple models of continuum mechanics: Ideal incompressible fluid. Classical elasticity. Viscous incompressible fluid. Ideal compressible fluid, sound waves.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Atkin and Fox "An Introduction to the Theory of Elasticity" (Shelfmark 531.38 (A), ISBN 0486442411)
B Hunter "Mechanics of Continuous Media" (Shelfmark 531.01 (H), ISBN 0853125708)
B Spencer "Continuum Mechanics" (Shelfmark 531.01 (S), ISBN 0486435946)
B Thompson "An Introduction to Astrophysical Fluid Dynamics" (Shelfmark 523.01 (T), ISBN 186094633X)

Assessment

One formal 2 hour written examination. Format: 4 questions from 5.

MAS312: Classical Control

Semester 1 10 credits

Prerequisites:	MAS103 (Differential and Difference Equations)
Prerequisite for:	
Cannot be taken with:	

Description

Every day we control systems to behave in the manner we want, whether it be driving a car or controlling a central heating system to keep us warm. Control theory aims to bring out the common features behind control systems and to find design rules. This course gives an introduction to some ideas of linear control theory. We look at dynamical systems which we can model by linear differential equations, and see how they respond to various inputs. The Laplace transform plays an important role and enables us to develop what are called frequency domain techniques for stability.

Aims

- To build on previous mathematical knowledge and introduce the Laplace Transform.
- To study classical control theory.

Outline syllabus

- Introduction to control
- Laplace Transforms
- Impulse and step responses
- Stability
- Routh Table
- Root Locus
- Frequency Response
- Nyquist Criterion

Module Format

Lectures	20	Tutorials	3	Practicals	0

Recommended books

B Dorf “Modern Control Systems” (Shelfmark 629.83 (D), ISBN 0131457330)

Assessment

One formal 2 hour written examination [75%]. Format: 4 questions from 5. Mini-project [25%].

MAS314: Introduction to Relativity

Semester 1 10 credits

Prerequisites:	MAS112 (Vectors and Mechanics)
Prerequisite for:	
Cannot be taken with:	

Description

Einstein's theory of relativity is one of the corner stones of our understanding of the universe. This course will introduce some of the ideas of relativity and the physical consequences of the theory, many of which are highly counter-intuitive. For example, a rapidly moving body will appear to be contracted as seen by an observer at rest. The course will also introduce one of the most famous equations in the whole of mathematics: $E = Mc^2$.

Aims

- To motivate the need for relativity as a theory;
- To introduce the key ideas;
- To introduce some simple applications in collisions and kinematics.

Outline syllabus

- **The need for special relativity:** Galilean relativity in Newtonian Mechanics. The Aether problem.
- **Foundations of special relativity** Axioms of special relativity; Lorentz transformations; time dilation; length contraction, Minkowski space.
- **Kinematics in special relativity:** Velocity and acceleration four-vectors; uniform acceleration; momentum; $E = Mc^2$;
- **Collisions in special relativity:** Conservation of mass and momentum; applications to simple particle collisions.
- **The need for general relativity:** Why special relativity cannot be the whole story.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B d'Inverno "Introducing Einstein's relativity" (Shelfmark 530.11 (D), ISBN 0198596863)

B Giulini "Special Relativity - A First Encounter: 100 Years Since Einstein" (Shelfmark 530.11 (G), ISBN 0198567464)

B Rindler "Introduction to Special Relativity" (Shelfmark 530.11 (R), ISBN 0198539525)

Assessment

One formal 2 hour written examination. Format: 4 questions from 5.

MAS315: Waves

Semester 1 10 credits

Prerequisites:	MAS112 (Vectors and Mechanics)
Prerequisite for:	
Cannot be taken with:	

Description

Studying wave phenomena has had a great impact on Applied Mathematics. This module looks at some important wave motions with a view to understanding them by developing from first principles the key mathematical tools. We begin with waves on strings (e.g., a piano or violin), developing the concept of standing and progressive waves, and normal modes. Fourier series are used to solve problems relating to waves on strings and membranes. Sound waves and water waves are considered. The concepts of dispersion and group velocity are introduced. The course concludes with consideration of "traffic waves" as the simplest example of nonlinear waves.

Aims

- To introduce wave propagation.
- To derive important mathematical tools to deal with problems of wave theory.
- To consider simple examples of linear waves on strings, sound waves and water waves.
- To give you one of simplest examples of nonlinear waves.

Outline syllabus

- Waves on strings. D'Alembert solution. Standing and propagating waves. Normal modes.
- Use of Fourier series for solving one-dimensional wave problems.
- Sound waves. Plane, cylindrical and spherical sound waves.
- Water waves. Wave dispersion. Group velocity.
- Traffic waves.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B See list at: http://www.robertus.staff.shef.ac.uk/ama349/info.html

Assessment

One formal 2 hour written examination. Format: 4 questions from 5.

MAS320: Fluid Mechanics I

Semester 2 10 credits

Prerequisites:	MAS270 (Vectors and Fluids); MAS271 (Methods for Differential Equations); MAS310 (Continuum Mechanics)
Prerequisite for:	MAS411 (Topics in Advanced Fluid Mechanics)
Cannot be taken with:	

Description

The way in which fluids move is of immense practical importance; the most obvious examples of this are air and water, but there are many others such as lubricants in engines — and alcohol! Moreover, the scientific principles and mathematical techniques needed to explain fluid motion are of intrinsic interest. This half-module builds on Level 2 work (MAS270 Vectors and Fluid Mechanics; MAS271 Methods for Differential Equations) and, more particularly, the ground work covered in MAS310 Continuum Mechanics. The first step is to derive the equation (Navier-Stokes equations) governing the motions of most common fluids. These serve as a basis for the remainder of MAS320.

Aims

- To broaden the students' knowledge of Fluid Mechanics.
- To introduce students to the mathematical and physical concepts used in the area of Fluid Dynamics.

Outline syllabus

- Rate of strain tensor: Derivation and interpretation. Constitutive equation.
- Exact solutions of the Navier-Stokes equations: Simple shear flow. Poiseuille flow. Steady flow under gravity down an inclined plane. Flow with circular streamlines. Infinite plate impulsively started into motion.
- Vector and tensor identities: manipulation of Navier-Stokes equations. Stress tensor and stress vector.
- Flow past a sphere: Derivation of Stokes drag on a sphere for small Reynolds number.
- Vorticity: Reynolds number. Vorticity equation. Role of irrotational flow. Burgers vortex. Vortex lines. Lagrange's theorem.
- Boundary layers: Flow past a flat plate. Skin friction drag. Displacement thickness. Momentum thickness. The Blasius solution. Von Kármán momentum integral equation.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **B** Acheson "Elementary Fluid Dynamics" (Shelfmark 532.5 (A), ISBN 0198596790)
- **B** Landau and Lifshitz "Fluid Mechanics" (Shelfmark 530.1 (L), ISBN 0750627670)
- **B** Paterson "A First Course in Fluid Dynamics" (Shelfmark 532.51 (P), ISBN 0521274249)

Assessment

One formal 2 hour written examination. Format: 4 questions from 5.

MAS322: Operations Research

Semester 2 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS202 (Advanced Calculus)
Prerequisite for:	
Cannot be taken with:	MAS423 (Advanced Operations Research)

Description

Mathematical Programming is the title given to a collection of optimisation algorithms that deal with constrained optimisation problems. Here the problems considered will all involve constraints which are linear, and for which the objective function to be maximised or minimised is also linear. These problems are not continuously differentiable; special algorithms have to be developed. The module considers not only the solution of such problems but also the important area of post-optimality analysis; i.e., given the solution can one answer questions about the effect of small changes in the parameters of the problem (such as values of the cost coefficients)?

Aims

- To develop the mathematical skills that will provide you with the appropriate foundations for further mathematical studies.
- To enable you to analyse OR problems that may arise in your future employment.

Outline syllabus

- Graphical techniques: Converting a "word" problem into a mathematical model and, for two-dimensional problems, determining the solution using the graphical technique.
- The Simplex Method: A heuristic development of the Simplex Algorithm based on the graphical technique followed by a rigorous analysis of the algorithm.
- Artificial variables, The M-Method and the Two-Phase Simplex Method: The use of artificial variables for problems with "=" and "≥" constraints; the development of the M-Method and the Two-Phase method.
- Duality and the Dual Simplex Method: The Dual problem and its relation to the Primal; methods of determining the Dual; the relation of the dual variables to shadow costs and the Simplex tableau; the Dual Simplex method.
- Elementary Sensitivity analysis: Adding and removing constraints; changing cost coefficients and right-hand side values; use of duality.
- Integer Programming: Description of dichotomy problems and 0-1 variables.
- Game Theory: Basic introduction to two-person-zero-sum games.

Module Format

Lectures	20	Tutorials	1	Practicals	0

Recommended books

A Taha "Operations Research" (Shelfmark 519.38 (T), ISBN 0131889230)

A Winston "Introduction to Mathematical Programming" (Shelfmark 519.7 (W), ISBN 0534359647)

B Bertsimas and Tsitsiklis "Introduction to Linear Optimization." (Shelfmark 519.72 (B), ISBN 1886529191)

Assessment

One formal 2 hour written examination [75%]. Format 4 questions from 5. Mini-project [25%].

MAS323: Differential Equations: A Case Study

Semester 2 10 credits

Prerequisites:	MAS271 (Methods for Differential Equations)
Prerequisite for:	
Cannot be taken with:	MAS424 (Differential Equations (Advanced))

Description

Differential equations arise in study of phenomena in a huge variety of circumstances; for example, biology, economics, astrophysics, weather forecasting and engineering. It follows that they are fundamental to modern applied mathematics. They also take on a very wide variety of forms. This course restricts itself to those which have a single independent variable – the ordinary differential equations (ODEs). ODEs describing a variety of physical systems are considered, with a strong emphasis being placed on showing how these equations are formulated to model the system under consideration. Methods required to formulate and solve these equations are developed in the module as necessary. The module is structured as a case-study in how important ideas in applied mathematics originally came about and were subsequently developed.

Aims

- To deepen existing understanding of how applied mathematics is developed and used by reference to the ordinary differential equation in the context of (primarily) evolutionary systems.

Outline syllabus

- Case studies from ecology, biology, chemical engineering, gravitation.
- Phase-plane methods for non-linear systems, analysis (including stability issues), diffusion, Fourier methods, reaction-diffusion, waves in biological systems, calculus of variations.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **A** Murray "Mathematical Biology" (Shelfmark 570.15118 (M), ISBN 0387952233)
- **B** Burghes and Borrie "Modelling with differential equations" (Shelfmark 511.8 (B), ISBN 0853122865)

- **C** Wheeler "Rethinking mathematical concepts" (Shelfmark 510 (W), ISBN 0853122849)

Assessment

One formal 2 hour written examination. Format: 4 questions from 4.

MAS324: Milestones in Applied Mathematics II: Quantum Theory

Semester 2 10 credits

Prerequisites:	MAS112 (Vectors and Mechanics)
Prerequisite for:	
Cannot be taken with:	PHY202 (Quantum Mechanics)

Description

The development of quantum theory revolutionized both physics and mathematics during the 20th century. The theory has applications in many technological advances, including: lasers, super-conductors, modern medical imaging techniques, transistors and quantum computers. This course introduces the basics of the theory and brings together many aspects of mathematics: for example, probability, matrices and complex numbers. Only first year mechanics is assumed, and other mathematical concepts will be introduced as they are needed.

Aims

- To introduce the subject of quantum mechanics;
- To study simple quantum systems;
- To introduce some of the historical aspects of the subject.

Outline syllabus

- **Historical introduction:** Brief introduction to the experiments leading to the development of quantum theory and motivation of Schrödinger's equation.
- **Simple quantum systems:** Particle in an infinite potential well, stationary states, expectation values, conservation of probability; simple scattering, potential step, potential barrier, finite potential well; 2-D potential well, degeneracy; finite-dimensional quantum systems.
- **Mathematical aspects of quantum theory:** Position and momentum operators; commutation relations; uncertainty principle.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **B** Bransden and Joachain "Introduction to Quantum Mechanics" (Shelfmark 530.12 (B), ISBN 0582444985)
- **B** Davies "Quantum Mechanics" (Shelfmark 530.12 (D), ISBN 0710099622)
- **B** Rae "Quantum Mechanics" (Shelfmark 530.12 (R), ISBN 0750308397)

Assessment

One formal 2 hour written examination [100%]. Format: 4 questions from 5.

MAS325: Mathematical Methods

Semester 2 10 credits

Prerequisites:	MAS272 (Applied Differential Equations)
Prerequisite for:	
Cannot be taken with:	

Description

This course introduces methods which are useful in many areas of mathematics. The emphasis will mainly be on obtaining approximate solutions to problems which involve a small parameter and cannot easily be solved exactly. These problems will include the evaluation of integrals and the solution of differential equations. Examples of possible applications are: oscillating motions with small nonlinear damping, the effect of other planets on the Earth's orbit around the Sun, boundary layers in fluid flows, electrical capacitance of long thin bodies, central limit theorem correction terms for finite sample size.

Aims

- To develop methods for solving differential equations using integral transforms and representations.
- To introduce asymptotic methods for evaluating integrals.
- To introduce asymptotic methods for solving differential equations.

Outline syllabus

- Integral methods and differential equations: Dirac δ-function, Fourier and Laplace transforms, applications to differential equations, Green functions.
- Asymptotic expansions: algebraic equations with small parameter, asymptotic expansion of functions defined by integrals.
- Differential equations with a small parameter.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Assessment

One formal 2 hour written examination. Format: 4 questions from 5.

MAS330: Topics in Number Theory

Semester 1 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS202 (Advanced Calculus)
Prerequisite for:	
Cannot be taken with:	MAS208 (Topics in Number Theory)

Description

This unit aims to investigate some of the properties of the natural numbers $1, 2, 3, \ldots$. Topics covered include linear and quadratic congruences, Fermat's Little Theorem, the RSA cryptosystem, the Law of Quadratic Reciprocity, perfect numbers, Mersenne primes, Fermat's Last Theorem, continued fractions, and Pell's equation.

Aims

- To introduce various topics in non-analytic number theory

Outline syllabus

- Linear congruences
- Fermat's Little Theorem
- The RSA cryptosystem
- Quadratic congruences with prime moduli
- Perfect numbers
- Mersenne primes
- Fermat numbers
- Pythagorean triples
- Fermat's Last Theorem
- Continued fractions
- Pell's equation

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Burton "Elementary number theory" (Shelfmark 512.81 (B), ISBN 0071121749)
C Singh "Fermat's Last Theorem" (Shelfmark 511.52(S), ISBN 000724181X)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS331: Metric Spaces

Semester 1 10 credits

Prerequisites:	MAS207 (Continuity and Integration)
Prerequisite for:	MAS435 (Algebraic Topology), MAS436 (Functional Analysis)
Cannot be taken with:	

Description

This unit explores ideas of convergence of iterative processes in the more general framework of metric spaces. A metric space is a set with a "distance function" which is governed by just three simple rules, from which the entire analysis follows. The course follows on from MAS207 'Continuity and Integration', and adapts some of the ideas from that course to the more general setting. The course ends with the Contraction Mapping Theorem, which guarantees the convergence of quite general processes; there are applications to many other areas of mathematics, such as to the solubility of differential equations.

Aims

- To point out that iterative processes and convergence of sequences occur in many areas of mathematics, and to develop a general context in which to study these processes
- To provide a basic course in analysis in this setting
- To reinforce ideas of proof
- To illustrate the power of abstraction and show why it is worthwhile
- To provide a foundation for later analysis courses

Outline syllabus

- Examples of iterative processes in various settings
- Metric spaces: definition, properties and examples
- Convergence of sequences
- Closed subsets, continuity
- Cauchy sequences, completeness, compactness
- The Contraction Mapping Theorem

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **B** Bryant "Metric spaces: iteration and application" (Shelfmark 512.811 (B), ISBN 0521268575)
- **B** Carothers "Real Analysis" (Shelfmark 517.51 (C), ISBN 0521497493)
- **B** Haaser and Sullivan "Real Analysis" (Shelfmark 517.51(H), ISBN 0486665097)
- **C** Kreyszic "Introductory Functional Analysis with applications" (Shelfmark 517.5 (S), ISBN 0471507318)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS332: Complex Analysis

Semester 1 10 credits

Prerequisites:	MAS202 (Advanced Calculus)
Prerequisite for:	MAS430 (Analytic Number Theory), MAS436 (Functional Analysis)
Cannot be taken with:	

Description

It is natural to use complex numbers in algebra, since these are the numbers we need to provide the roots of all polynomials. In fact, it is equally natural to use complex numbers in analysis, and this course introduces the study of complex-valued functions of a complex variable. Complex analysis is a central area of mathematics. It is both widely applicable and very beautiful, with a strong geometrical flavour. This course will consider some of the key theorems in the subject, weaving together complex derivatives and complex line integrals. There will be a strong emphasis on applications. Anyone taking the course will be expected to know the statements of the theorems and be able to use them correctly to solve problems.

Aims

- To introduce complex functions of a complex variable
- To demonstrate the critical importance of differentiability of complex functions of a complex variable, and its surprising relation with path-independence of line integrals
- To demonstrate the relevance of power series in complex analysis
- To develop the subject of complex analysis rigorously, highlighting its logical structure and proving several of the fundamental theorems
- To discuss some applications of the theory, including to the calculation of real integrals

Outline syllabus

- Revision of complex numbers
- Special functions
- Simple integrals of complex-valued functions
- Open sets, neighbourhoods and regions
- Differentiability; Cauchy-Riemann equations, harmonic functions
- Power series and special functions
- Complex line integrals
- Cauchy's Theorem
- Cauchy's integral formula and Cauchy's formula for derivatives
- Taylor's Theorem
- Laurent's Theorem and singularities
- Cauchy's Residue Theorem and applications

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Priestley "Introduction to complex analysis" (Shelfmark 517.53 (P), ISBN 0198534299)
B Stewart and Tall "Complex analysis" (Shelfmark 517.53 (S), ISBN 0521245133)
B Wunsch "Complex Variables with Applications" (ISBN 0201122995)
C Spiegel "Schaum" (Shelfmark 517.53 (S), ISBN 0070843821)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS333: Fields

Semester 1 10 credits

Prerequisites:	MAS276 (Rings and Groups); MAS277 (Vector Spaces and Fourier Theory)
Prerequisite for:	MAS442 (Galois Theory)
Cannot be taken with:	

Description

A field is a set where the familiar operations of arithmetic are possible. It often happens, particularly in the theory of equations, that one needs to extend a field by forming a bigger one. The aim of this course is to study the idea of field extension and various problems where it arises. In particular, it is used to answer some classical problems of Greek geometry, asking whether certain geometrical constructions, such as angle trisection or squaring the circle, are possible.

Aims

- To illustrate how questions concerning the complex roots of real or rational polynomial equations can quickly lead to the study of subfields of the field of complex numbers
- To consolidate previous knowledge of field theory and vector space theory
- To illustrate how the general mathematical theory of vector spaces can be used to good effect in the theory of field extensions
- To illustrate how the theory of dimensions of vector spaces can be used to prove that certain ruler and compass constructions are impossible
- To illustrate the relevance of factorization of polynomials to the theory of algebraic field extensions

Outline syllabus

- Field extensions
- Factorization of polynomials
- Simple field extensions
- Towers of fields
- Ruler and compass constructions

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Allenby “Rings, fields and groups” (Shelfmark 512.8 (A), ISBN 0340544406)
B Fraleigh “A first course in abstract algebra” (Shelfmark 512.8 (F), ISBN 0201534673)
B Herstein “Abstract algebra” (Shelfmark 512.8 (H), ISBN 0023538228)
B Stewart “Galois theory” (Shelfmark 512.43 (S), ISBN 0412345404)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS334: Combinatorics

Semester 1 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS202 (Advanced Calculus)
Prerequisite for:	
Cannot be taken with:	

Description

Combinatorics is the mathematics of selections and combinations. For example, given a collection of sets, when is it possible to choose a different element from each of them? That simple question leads to Hall's Theorem, a far-reaching result with applications to counting and pairing problems throughout mathematics.

Aims

- To illustrate the wide range of selection problems in combinatorial mathematics
- To teach the basic techniques of selection and arrangement problems
- To show how to solve a wide range of natural counting problems using these techniques

Outline syllabus

- The binomial coefficients
- Three basic principles: parity, pigeon-holes and inclusion/exclusion
- Rook polynomials
- Hall's Marriage Theorem and its applications
- Latin squares
- Block designs and codes

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Anderson "A first course in combinatorial mathematics" (Shelfmark 519.21 (A), ISBN 0198596731)
B Bryant "Aspects of combinatorics" (Shelfmark 519.21 (B), ISBN 0521429978)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS336: Differential Geometry

Semester 1 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS202 (Advanced Calculus)
Prerequisite for:	MAS441 (Optics and Symplectic Geometry)
Cannot be taken with:	

Description

What is differential geometry? In short, it is the study of geometric objects using calculus. In this introductory course, the geometric objects of our concern are curves and surfaces. Besides calculating such familiar quantities as lengths, angles and areas, much of our focus is on how to measure the 'shape' of a geometric object. The story is relatively simple for curves, but naturally becomes more involved for surfaces – and more interesting too. Well-known notions (e.g. straight lines) and results (e.g. sum of angles in a triangle) in Euclidean geometry are to be modified, in certain precise ways, for general surfaces. The course concludes with the celebrated Gauss-Bonnet Theorem, which shows how small- and large-scale behaviours of a surface can impact each other.

Aims

- To introduce the subject of differential geometry – its ideas, tools and applications
- To formalize intuitive geometric ideas so as to study them more precisely and obtain sophisticated results
- To describe many examples of curves and surfaces to illustrate various geometric notions
- To demonstrate the interplay between local and global behaviours of geometric objects

Outline syllabus

- **Curves**: basic definitions; plane curves: curvature; space curves: curvature & torsion
- **Surfaces**: basic definitions; first fundamental form: metric properties; second fundamental form: curvature properties; parallel transport & geodesics; Gauss' Remarkable Theorem; Gauss-Bonnet Theorem

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Pressley "Elementary differential geometry" (Shelfmark 513.73 (P), ISBN 1852331526)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS341: Graph Theory
Semester 2 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS202 (Advanced Calculus)
Prerequisite for:	
Cannot be taken with:	

Description

A "graph" is a simple mathematical structure consisting of a collection of points, some pairs of which are joined by lines. Their basic nature means that they can be used to illustrate a wide range of situations. The aim of this course is to investigate the mathematics of these structures and to use them in a wide range of applications. Topics covered include trees, Eulerian and Hamiltonian graphs, planar graphs, embedding of graphs in surfaces, colouring of graphs.

Aims

- To expound the theory of graphs with brief consideration of some algorithms

Outline syllabus

- Definition and examples
- Trees
- Eulerian graphs
- Hamiltonian graphs
- The Travelling Salesman Problem
- The Shortest and Longest Path Algorithms
- Planar graphs
- Embedding graphs in surfaces
- Vertex colouring
- Edge colouring
- Face colouring

Module Format

Lectures	20	Tutorials	0	Practicals	0

MAS342: Applicable Analysis

Semester 2   10 credits

Prerequisites:	MAS202 (Advanced Calculus); MAS332 (Complex Analysis) desirable
Prerequisite for:	
Cannot be taken with:	

Description

Over the years mathematical tools have been developed to solve practical problems which have arisen naturally in the course of research. Many of these problems involve the evaluation of integrals or the solution of differential equations and so are essentially concerned with calculus. This is a course made up of topics which have numerous applications and is ideal for those who can cope with calculus and enjoy it.

The aim of this module is to develop the theory of a number of analytical tools in such a way as to acquaint the students with the underlying theory and to teach them the capabilities and limitations of the methods. The course will include plenty of examples so that students learn to use the tools correctly. Topics covered are improper integrals, Gamma and Beta functions and the theory of Laplace transforms. They are used to evaluate integrals and to solve ordinary and partial differential equations.

As some students will reach the third year without meeting differential equations, an introductory section on differential equations is included in the course.

Aims

- To introduce students to some topics which are analytical in nature and are widely applicable
- To train the students to be able to use the Gamma and Beta functions and Laplace transforms correctly to solve a variety of problems

Outline syllabus

- Improper integrals of the first and second kind
- Change of order in repeated integrals of the form $\int_c^d \int_a^\infty f(x,y)\ dx\ dy$; differentiation under the integral sign for $\int_a^\infty f(x,t)\ dt$
- Gamma and Beta functions and the relationship between them
- Applications of Gamma and Beta functions
- Laplace transforms
- The convolution of two functions and its Laplace transform
- Applications of Laplace transforms to the evaluation of integrals and the solution of ordinary and partial differential equations

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **B** Spiegel "Schaum outline of theory and problems of Laplace transforms" (Shelfmark 517.35 (S), ISBN z0270248)
- **B** Widder "Advanced Calculus" (Shelfmark 517 (W), ISBN 0486661032)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS343: History of Mathematics

Semester 2 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS202 (Advanced Calculus)
Prerequisite for:	
Cannot be taken with:	

Description

The course aims to introduce the student to the study of the history of mathematics. The main topics discussed are Egyptian and Babylonian mathematics, early Greek mathematics, Renaissance mathematics, and the early history of the calculus.

Aims

- To introduce the student to the history of mathematics
- To place mathematical developments into historical perspective
- To train the student to study from a set text
- To encourage independent study and use of the University's libraries
- To allow students to research a topic and then write up a formal report or produce a poster on their findings, which counts towards the continuous assessment part of the course
- To discuss developments in mathematics in various periods, including its beginnings in the Egyptian and Mesopotamian civilizations, its flowering under the ancient Greeks and its renaissance in sixteenth-century Europe.
- To trace the pre-history of the calculus from its beginnings in Greece to its rapid expansion in seventeenth-century Europe.

Outline syllabus

- Introduction
- Egypt and Mesopotamia
- Early Greek mathematics
- Renaissance mathematics
- The route to the calculus

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **A** Boyer and Merzbach "A history of mathematics" (Shelfmark 510.9 (B), ISBN 0471543977)
- **B** Katz "A history of mathematics" (Shelfmark 510.9 (K), ISBN 0321016181)
- **C** Fauvel and Gray "The history of mathematics: a reader" (Shelfmark 510.9 (H), ISBN 0333427912)

Assessment

One formal 2.5 hour written examination [69%]. Format: 1 compulsory question plus 3 questions from 4. Coursework [31%].

MAS344: Knots and Surfaces

Semester 2 10 credits

Prerequisites:	MAS105 (Numbers and Proofs)
Prerequisite for:	
Cannot be taken with:	

Description

The course studies knots, links and surfaces in an elementary way. The key mathematical idea is that of an algebraic invariant: the Jones polynomial for knots, and the Euler characteristic for surfaces. These invariants will be used to classify surfaces, and to give a practical way to place a surface in the classification. Various connections with other sciences will be described.

Aims

- To present a classification, that of compact surfaces, beginning from definitions and basic examples
- To instill an intuitive understanding of knots and compact surfaces
- To introduce and illustrate discrete invariants of geometric problems
- To show that adding extraneous structure may give information independent of that structure
- To develop the theory of the Euler characteristic
- To illustrate how a general mathematical theory can apply to quite different physical objects, and solve very specific problems about them

Outline syllabus

- Knots and links
- The Jones polynomial
- Surfaces
- The Euler characteristic
- Seifert surfaces

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Firby and Gardiner "Surface topology" (Shelfmark 513.83 (F), ISBN 1898563772)
C Adams "The knot book" (Shelfmark 513.83 (A), ISBN 0821836781)
C Cundy and Rollett "Mathematical models" (Shelfmark 510.84 (C), ISBN 0906212200)
C Gilbert and Porter "Knots and surfaces" (Shelfmark 513.83 (G), ISBN 0198514905)
C Kauffman "On knots" (Shelfmark 513.83 (K), ISBN 0691084351)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS345: Codes and Cryptography

Semester 2 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS208 (Topics in Number Theory) or MAS330 (Topics in Number Theory)
Prerequisite for:	
Cannot be taken with:	

Description

The word 'code' is used in two different ways. The ISBN code of a book is designed in such a way that simple errors in recording it will not produce the ISBN of a different book. This is an example of an 'error-correcting code' (more accurately, an error-detecting code). On the other hand, we speak of codes which encrypt information — a topic of vital importance to the transmission of sensitive financial information across the internet. These two ideas, here labelled 'Codes' and 'Cryptography', each depend on elegant pure mathematical ideas: codes on linear algebra and cryptography on number theory. This course explores these topics, including the real-life applications and the mathematics behind them.

Aims

- To introduce the basic ideas connected with error detection and error correction, and various examples of useful codes
- To demonstrate the importance of the simple concepts of Hamming distance and the minimum distance of a code in the theory of error detection and error correction
- To illustrate how linear algebra can be used to good effect in the theory of linear codes
- To give an overview of cryptography from the most basic examples to modern public key systems
- To introduce the number-theoretic concepts used in public-key cryptosystems and to show how these are applied in practical examples

Outline syllabus

- Codes and linear codes
- Hamming distance
- Examples of error-correcting/error-detecting codes
- Classical methods of cryptography
- Results from number theory
- Public key methods of cryptography

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **C** Hill "A first course in coding theory" (Shelfmark 003.54 (H), ISBN 0198538030)
- **C** Koblitz "A course in number theory and cryptography" (Shelfmark 512.81 (K), ISBN 0387942939)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS346: Groups and Symmetry

Semester 2 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS276 (Rings and Groups)
Prerequisite for:	
Cannot be taken with:	

Description

Groups arise naturally as collections of symmetries. Examples considered include symmetry groups of Platonic solids. Groups can also act as symmetries of other groups. These actions can be used to prove the Sylow theorems, which give important information about the subgroups of a given finite group, leading to a classification of groups of small order.

Aims

- To consolidate previous knowledge of the group theory, symmetries and linear algebra
- To introduce and illustrate the process of analysis of a finite group from its local structure
- To illustrate how properties of a group can be studied using the properties of its subgroups

Outline syllabus

- Orthogonal and special orthogonal symmetries of $\mathbf{R}^n$
- The centre of a group; examples
- Homomorphisms and automorphisms of groups
- Quotient groups and isomorphism theorems
- Group actions, Sylow theorems, and simple groups
- Symmetry and direct symmetry groups
- Groups of symmetries of the platonic solids
- The direct product and semi-direct product of groups
- Groups of small order

Module Format

Lectures 20	Tutorials 0	Practicals 0

Recommended books

B Armstrong "Groups and symmetry" (Shelfmark 512.86 (A), ISBN 0387966757)
B Dummit "Abstract algebra" (Shelfmark 512.8 (D), ISBN 0130047716)

C Artin "Algebra" (Shelfmark 512 (A), ISBN 0130047635)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS350: Measure and Probability

Semester 2 10 credits

Prerequisites:	MAS207 (Continuity and Integration)
Prerequisite for:	
Cannot be taken with:	

Description

Measure theory is that branch of mathematics which evolves from the idea of "weighing" a set by attaching a non-negative number to it which signifies its worth. This generalises the usual physical ideas of length, area and mass as well as probability. It turns out (as we will see in the course) that these ideas are vital for developing the modern theory of integration.
The module will give students an additional opportunity to develop skills in modern analysis as well as providing a rigorous foundation for probability theory. In particular it would form a useful precursor or companion course to the Level 4 courses MAS436 (Functional Analysis) and MAS452 (Stochastic Processes and Finance), the latter of which is fundamentally dependent on measure theoretic ideas.

Aims

- give a more rigorous introduction to the theory of measure.
- develop the ideas of Lebesgue integration and its properties.
- recall the concepts of probability theory and consider them from a measure theoretic point of view.
- prove the Central Limit Theorem using these methods.

Outline syllabus

- The scope of measure theory,
- σ-algebras,
- Properties of measures,
- Measurable functions,
- The Lebesgue integral,
- Interchange of limit and integral,
- Probability from a measure theoretic viewpoint,
- Characteristic functions,
- The central limit theorem.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

C D.Williams "Probability with Martingales" (Shelfmark 519.236(W), ISBN 0521406056)
C D.Cohn "Measure Theory" (Shelfmark 3B 517.29(C), ISBN 0817630031)
C J.Rosenthal "A First Look at Rigorous Probability" (Shelfmark 519.2(R), ISBN 0810243030)

Assessment

One formal 2 hour written examination.

MAS360: Practical and Applied Statistics

Semester Year   20 credits

Prerequisites:	MAS273 (Statistical Modelling)
Prerequisite for:	
Cannot be taken with:	MAS301 (Group Project)

Description

The overall aim of the course is to give students practice in the various stages of dealing with a real problem: objective definition, preliminary examination of data, modelling, analysis, computation, interpretation and communication of results. It could be said that while other courses teach how to do statistics, this teaches how to be a statistician. There will be a series of projects and other exercises directed towards this aim. Projects will be assessed, but other exercises will not.

Aims

- To develop students' skills in open-ended tasks with a substantial statistical aspect.
- To develop students' abilities to report on the results of their investigations.

Outline syllabus

- There is no technical syllabus for this course; indeed it is deliberately arranged that no new theory is needed, although students may need to use extended versions of familiar topics or invent ad hoc methods. Instruction is given in writing reports and in tackling imprecisely worded or open-ended problems. Feedback on projects attempted continues this instruction.

Module Format

Lectures	30	Tutorials	0	Practicals	0

Recommended books

- There are no recommended books for this course.

Assessment

Entirely continuous assessment, through project reports and presentations. The weighting and deadlines will be announced during the module.

MAS361: Medical Statistics

Semester 1   10 credits

Prerequisites:	MAS173 (Probability and Inference); MAS205 (Statistics Core) recommended
Prerequisite for:	
Cannot be taken with:	MAS461 (Medical Statistics)

Description

This course comprises sections on Clinical Trials and Survival Data Analysis. The special ethical and regulatory constraints involved in experimentation on human subjects mean that Clinical Trials have developed their own distinct methodology. Students will, however, recognise many fundamentals from mainstream statistical theory. The course aims to discuss the ethical issues involved and to introduce the specialist methods required. Prediction of survival times or comparisons of survival patterns between different treatments are examples of paramount importance in medical statistics. The aim of this course is to provide a flavour of the statistical methodology developed specifically for such problems, especially with regard to the handling of censored data (e.g., patients still alive at the close of the study). Most of the statistical analyses can be implemented in standard statistical packages.

Aims

- To illustrate applications of statistics within the medical field.
- To introduce students to some of the distinctive statistical methodologies developed to tackle problems specifically related to clinical trials and the analysis of survival data.

Outline syllabus

Clinical Trials:

- **Basic concepts and designs:** controlled and uncontrolled clinical trials; historical controls; protocol; placebo; randomisation; blind and double blind trials; ethical issues; protocol deviations.
- **Size of trials.**
- **Multiplicity and meta-analysis:** interim analyses; multi-centre trials; combining trials.
- **Cross-over trials.**
- **Binary response data:** logistic regression modelling; McNemar's test, relative risks, odds ratios.

Survival Data Analysis:

- **Basic concepts:** survivor function; hazard function; censoring.
- **Single sample methods:** lifetables; Kaplan-Meier survival curve; parametric models.
- **Two sample methods**: log-rank test; parametric comparisons.
- **Regression models**: inclusion of covariates; Cox's proportional hazards model; parametric and accelerated failure time regression models.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **A** Everitt and Rabe-Heskith "Analyzing Medical Data Using S-Plus" (Shelfmark 610.285 (E), ISBN 0387988629)
- **A** Matthews "An Introduction to Randomized Controlled Clinical Trials" (Shelfmark 615.50724 (M), ISBN 1584886242)
- **B** Altman "Practical Statistics for Medical Research" (Shelfmark 519.023 (A), ISBN 1584880392)
- **B** Campbell "Statistics at Square Two" (Shelfmark 519.023 (C), ISBN 1405134909)
- **B** Collett "Modelling Survival Data in Medical Research" (Shelfmark 610.727 (C), ISBN 1584883251)

Assessment

One formal 2 hour written examination. Format: 3 questions from 4.

MAS362: Financial Mathematics

Semester 1 10 credits

Prerequisites:	MAS205 (Statistics Core)
Prerequisite for:	MAS452 (Stochastic Processes and Finance)
Cannot be taken with:	MAS462 (Financial Mathematics)

Description

The discovery of the Capital Asset Pricing Model by William Sharpe in the 1960's and the Black-Scholes option pricing formula a decade later mark the beginning of a very fruitful interaction between mathematics and finance. The latter obtained new powerful analytical tools while the former saw its knowledge applied in new and surprising ways. (A key result used in the derivation of the Black-Scholes formula, Ito's Lemma, was first applied to guide missiles to their targets; hence the title 'rocket science' applied to financial mathematics.) This course describes the mathematical ideas behind these developments together with their applications in modern finance.

Aims

- To introduce students to the mathematical ideas and methods used in finance.
- To familiarise students with financial instruments such as shares, bonds, forward contracts, futures and options.
- To familiarise students with the notion of arbitrage and the notion of no-arbitrage pricing.
- To introduce the binomial tree and geometric Brownian motion models for stock prices.
- To familiarise students with the Black-Scholes option pricing method.
- To introduce the Capital Asset Pricing Model.

Outline syllabus

- Introduction, arbitrage, forward and futures contracts
- Options, binomial trees, risk-neutral valuation
- Brownian motion and share prices, the Black-Scholes analysis
- Portfolio theory, the Capital Asset Pricing Model.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Capinski and Zastawniak "Mathematics for Finance: An Introduction to Financial Engineering" (Shelfmark 332.0151 (C), ISBN 1852333308)

B Hull "Options, futures and other derivatives" (Shelfmark 332.645 (H), ISBN 0131499084)

B Sharpe "Portfolio theory and capital markets" (Shelfmark 332.6 (S), ISBN 0071353208)

Assessment

One formal 2.5 hour written examination. Format: 3 questions from 4.

MAS363: Linear Models

Semester 1 10 credits

Prerequisites:	MAS205 (Statistics Core); MAS273 (Statistical Modelling) recommended
Prerequisite for:	MAS473 (Extended Linear Models)
Cannot be taken with:	MAS463 (Linear Models)

Description

The course will develop the general theory of linear models, an important class of statistical models. It will also discuss model building and model checking in the context of regression. Multiple regression will be developed in some detail. Illustration using the R software will be given throughout.

Aims

- To review and extend the students knowledge of the standard linear model.
- To develop enough of the theory to allow a proper understanding of what these methods can achieve.
- To show how these methods are applied to data, and what kinds of conclusion are possible.

Outline syllabus

- **Simple Linear Regression**: Brief introductory examples on regression and the analysis of variance.
- **The General Linear Model**: The general linear model; reduced models; replicates and lack of fit; weighted and generalized least-squares.
- **Diagnostics and Model Revision**: Examination of residuals; types of residuals; influential observations; transformations.
- **More Linear Models and Model Building**: Use of the flexibility of the general linear model; strategy for model-building and variable selection.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

C Atkinson “Plots, Transformations and Regression” (Shelfmark 519.51 (A), ISBN 0198533594)

C Cook and Weisberg “Residuals and Influence in Regression” (Shelfmark 519.51 (C), ISBN 041224280X)

C Draper and Smith “Applied Regression Analysis” (Shelfmark 519.536 (D), ISBN 0471170828)

C Montgomery, Peck and Vining “Introduction to Linear Regression Analysis” (Shelfmark 519.51 (M), ISBN 0471754951)

C Seber and Lee “Linear Regression Analysis” (Shelfmark 519.51 (S), ISBN 0471415405)

Assessment

One formal 2 hour written examination. Format: 3 questions from 4.

MAS364: Bayesian Statistics

Semester 1 10 credits

Prerequisites:	MAS274 (Statistical Reasoning)
Prerequisite for:	MAS472 (Computational Inference)
Cannot be taken with:	MAS464 (Bayesian Statistics)

Description

This unit develops the Bayesian approach to statistical inference. The Bayesian method is fundamentally different in philosophy from conventional frequentist/classical inference, and has been the subject of some controversy in the past. It is, however, becoming increasingly popular in many fields of applied statistics. This course will cover both the foundations of Bayesian statistics, including subjective probability, utility and decision theory, and modern computational tools for practical inference problems, specifically Markov Chain Monte Carlo methods and Gibbs sampling. Applied Bayesian methods will be demonstrated in a series of case studies using the software package WinBUGS.

Aims

- To extend understanding of the practice of statistical inference.
- To familiarize the student with the Bayesian approach to inference.
- To describe computational implementation of Bayesian analyses.

Outline syllabus

- Subjective probability.
- Inference using Bayes Theorem. Prior distributions. Exponential families. Conjugacy. Exchangeability.
- Predictive inference.
- Utility and decisions. Tests and interval estimation from a decision-theoretic perspective.
- Model checking. Robustness. Sensitivity. Bayes factors for model checking.
- Hierarchical models.
- Computation. Gibbs sampling. Metropolis-Hastings. Graphical models. Case studies.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Gelman, Carlin, Stern and Rubin "Bayesian Data Analysis" (Shelfmark 519.42 (W), ISBN 0412039915)

B Lee "Bayesian Statistics: An Introduction" (Shelfmark 519.542 (L), ISBN 0340814055)

Assessment

One formal 2 hour written examination [85%]. Format: 3 questions from 4. Continuous assessment [15%].

MAS370: Sampling Theory and Design of Experiments

Semester 2 10 credits

Prerequisites:	MAS205 (Statistics Core); MAS273 (Statistical Modelling) recommended
Prerequisite for:	
Cannot be taken with:	

Description

The results of sample surveys through opinion polls are commonplace in newspapers and on television. The objective of the Sampling Theory section of the module is to introduce several different methods for obtaining samples from finite populations. Experiments which aim to discover improved conditions are commonplace in industry, agriculture, etc. The purpose of experimental design is to maximise the information on what is of interest with the minimum use of resources. The aim of the Design section is to introduce some of the more important design concepts.

Aims

- To consolidate some previous mathematical and statistical knowledge.
- To introduce statistical ideas used in sample surveys and the design of experiments.

Outline syllabus

- This course deals with two different areas where the important features are the planning before the data are collected, and the methods for maximising the information which will be obtained. The results of sample surveys through opinion polls, etc., are commonplace in newspapers and on television. The Sampling Theory component of the course introduces several different methods for obtaining samples from finite populations and considers which method is most appropriate for a given sampling problem. Experiments which aim to discover improved conditions are commonplace in industry, agriculture, etc. The purpose of experimental design is to maximise the information on what is of interest with the minimum use of resources. The Experimental Design component of the course introduces some of the more important design concepts.

Assessment

One formal 2 hour written examination. Format: 3 questions from 4.

MAS371: Applied Probability

Semester 2 10 credits

Prerequisites:	MAS274 (Statistical Reasoning); MAS275 (Probability Modelling)
Prerequisite for:	
Cannot be taken with:	

Description

This unit will link probability modelling to Statistics. It will explore a range of models that can be constructed for random phenomena that vary in time or space – the evolution of an animal population, for example, or the number of cancer cases in different regions of the country. It will illustrate how models are built and how they might be applied: how likelihood functions for a model may be derived and used to fit the model to data, and how the result may be used to assess model adequacy. Models examined will build on those studied in MAS275.

Aims

- Illustrate the construction of probability models for random phenomena;
- Introduce some of the common classes of models for random phenomena;
- Illustrate how probability models may be fitted to data;
- Discuss applications of fitted models.

Outline syllabus

- **Basic techniques**: likelihood functions and their properties and use.
- **Continuous time Markov chains**: Introduction; generator matrices; informal coverage of stationary distributions and convergence.
- **Inference for stochastic processes**: deriving likelihood functions for stochastic processes; fitting models to data; model criticism.
- **Applications of Markov chains**: birth-death processes; queues.
- **Point processes**: homogeneous and inhomogeneous Poisson processes, spatial and marked point processes, inference for point processes.

Module Format

Assessment

One 2 hour written examination.

MAS372: Time Series

Semester 2 10 credits

Prerequisites:	MAS273 (Statistical Modelling)
Prerequisite for:	
Cannot be taken with:	

Description

Time series are observations made in time, for which the time aspect is potentially important for understanding and use. The course aims to give an introduction to modern methods of time series analysis and forecasting as applied in economics, engineering and the natural, medical and social sciences. The emphasis will be on practical techniques for data analysis, though appropriate stochastic models for time series will be introduced as necessary to give a firm basis for practical modelling. For the implementation of the methods the programming language R will be used.

Aims

- To introduce methods to uncover structure in series of observations made through time.
- To illustrate how models for time series may be constructed and studied.
- To develop methods to analyse and forecast time series.
- To show how these methods are applied to data, and what kinds of conclusion are possible.

Outline syllabus

- Examples of time series. Purposes of analysis. Components (trend, cycle, seasonal, irregular). Stationarity and autocorrelation.
- Approaches to time series analysis. Simple descriptive methods: smoothing, decomposition.
- Differencing. Autocorrelation. Probability models for stationary series. Autoregressive models.
- Moving average models. Partial autocorrelation. Invertibility. ARMA processes.
- ARIMA models for non-stationary series. Identification and fitting. Diagnostics. Ljung-Box statistic.
- Review and practical examples of model fitting. Introduction to forecasting. Updating and errors.
- Dynamic linear models. The Kalman filter and forecasting.

Module Format

B Pole, West and Harrison "Applied Bayesian Forecasting and Time Series Analysis" (Shelfmark 519.55 (P), ISBN 0412044013)

Assessment

One formal 2 hour written examination. Format: 3 questions from 4.

MAS377: Mathematical Biology

Semester 2 10 credits

Prerequisites:	MAS103 (Differential and Difference Equations)
Prerequisite for:	
Cannot be taken with:	

Description

The course provides an introduction to the mathematical modelling of the dynamics of biological populations. The emphasis will be on deterministic models based on systems of differential equations that encode population birth and death rates. Examples will be drawn from a range of different dynamic biological populations, from the species level down to the dynamics of molecular populations within cells. Central to the course will be the dynamic consequences of feedback interactions within the populations. In cases where explicit solutions are not readily obtainable, techniques that give a qualitative picture of the model dynamics (including numerical simulation) will be used.

Aims

- To introduce students to the applications of mathematical techniques in deterministic models for population growth.

Outline syllabus

- **Population models:** Deterministic models; birth and death processes; logistic growth; competition between populations.
- **Epidemic models:** Compartment models; the SIR model.
- **Biochemical and Genetic Networks:** Mass-action kinetics; simple genetic circuits; genetic switches and clocks.
- **Spatial Pattern Formation:** Cellular models; lateral inhibition; reaction-diffusion; spatial pattern formation; the Turing mechanism.

Module Format

MAS400: Project Presentation in Mathematics and Statistics

Semester 1 10 credits

Prerequisites:
Prerequisite for:
Cannot be taken with: MAS301 (Group Project) simultaneously

Description

This unit provides training and experience in the use of appropriate computer packages for the presentation of mathematics and statistics, and guidance on the coherent and accurate presentation of technical information.

Aims

- To develop written skills for use in the level 4 project.
- To develop oral skills for use in the level 4 project.
- To develop general presentational skills usable in a wider context.

Outline syllabus

- Introduction to LaTeX and WinEdt
- Typesetting mathematics in LaTeX
- Writing mathematics and statistics
- Oral presentations
- The LaTeX beamer package

Module Format

Lectures	5	Tutorials	0	Practicals	6

Recommended books

B "The not-so-short introduction to LaTeX2e" (http://www.ctan.org/tex-archive/info/lshort/english/lshort.pdf)

Assessment

Coursework [65%]. Oral presentation [35%].

MAS406: Mathematics and Statistics Project

Semester Year 30 credits

Prerequisites:
Prerequisite for:
Cannot be taken with:

Description

The student selects a project topic offered by a member of staff and writes a project on this under the supervision of the member of staff. For more details, see p.26.

Aims

- to give students experience of, and training in, research and presentation of an advanced mathematical topic
- to support the development of independent study skills
- to support the acquisition of communication and presentation skills
- to provide an introduction to the research experience
- to give the opportunity to study a specialist topic of attraction to the student

Outline syllabus

There is no recorded outline syllabus for this module.

Module Format

Lectures	0	Tutorials	0	Practicals	0

Recommended books

- There are no recommended books for this course.

Assessment

30–40 page dissertation [90%]. Oral presentation [10%].

MAS411: Topics in Advanced Fluid Mechanics

Semester 1 20 credits

Prerequisites:	MAS320 (Fluid Dynamics I)
Prerequisite for:	
Cannot be taken with:	

Description

This module aims to describe advanced mathematical handling of fluid equations in an easily accessible fashion. A number of topics are treated in connection with the mathematical modelling of formation of the (near-)singular structures with concentrated vorticity in inviscid flows. After discussing prototype problems in one and two dimensions, the three-dimensional flows in terms of vortex dynamics are described. Mathematical tools are explained during the unit in a self-contained manner. Candidates are directed to read key original papers on some topics to deepen their understanding.

Aims

This unit aims to familiarise candidates with advanced mathematical techniques used in fluid mechanics, in particular in vortex dynamics, by working out prototype problems.

Outline syllabus

- Fluid dynamical equations revisited
- 1D model equations
- Vortex sheet problem
- Vortex patch problem
- 3D Euler equations
- 3D Navier-Stokes equations
- 2D incompressible fluid equations (if time permits)

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **C** Andrew J. Majda and Andrea L. Bertozzi "Vorticity and Incompressible Flow"
- **C** P.G.Saffman "Vortex Dynamics"

Assessment

One formal 2-hour written examination [80%]. Format: 3 questions from 4. Students will also be required to complete derivations from approx. 5 papers on a reading list [20%].

MAS412: Analytical Dynamics and Classical Field Theory

Semester Year 20 credits

Prerequisites:
Prerequisite for:
Cannot be taken with:

Description

Newton formulated his famous laws of mechanics in the late 17th century. Only later it became obvious through the work of mathematicians like Lagrange, Hamilton and Jacobi that underlying Newton's work are wonderful mathematical structures. In this module the work of Lagrange, Hamilton and Jacobi will be discussed and how it has later affected the formulation of field theory. The module ends with a discussion of Noether's theorem, which relates symmetries of a system to the conservation law of certain quantities (such as energy and momentum).

Aims

- to introduce students to the formulations of mechanics by Lagrange and Hamilton;
- to show how mechanical problems can be formulated in much simpler ways;
- introduce new mathematical methods: calculus of variations and canonical transformations;
- show how relativistic systems can be described in the formalisms of Lagrange and Hamilton;
- introduce the concept of a field and how the ideas of Lagrange and Hamilton can be extended to describe fields such as the gravitational field and the electromagnetic field;
- show how Noether's theorem relates the conservation of quantities like energy and momentum to symmetries in Nature.

Outline syllabus

- Formulations of Lagrange and Hamilton;
- Calculus of variations and canonical transformations;
- Interpretation of relativistic systems in the formalisms of Lagrange and Hamilton;
- Fields;
- Noether's theorem.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

Assessment

A formal 3 hour long examination.

MAS420: Signal Processing

Semester 1 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS277 (Vector Spaces and Fourier Theory)
Prerequisite for:	
Cannot be taken with:	

Description

The transmission, reception and extraction of information from signals is an activity of fundamental importance. This course describes the basic concepts and tools underlying the discipline, and relates them to a variety of applications. An essential concept is that a signal can be decomposed into a set of frequencies by means of the Fourier transform. From this grows a very powerful description of how systems respond to input signals. Perhaps the most remarkable result in the course is the celebrated Shannon-Whittaker sampling theorem, which tells us that, under certain conditions, a signal can be perfectly reconstructed from samples at discrete points. This is the basis of all modern digital technology.

Aims

- To develop the idea that a signal can be treated as a set of frequencies by using the Fourier transform.
- To exploit this representation to give fundamental insight into how systems act on signals.
- To demonstrate that a continuous (analog) signal can be sampled to produce a discrete (digital) signal, without any loss of information, as long as the signal contains only a finite range of frequencies.
- To convey the immense importance of these ideas to modern life.

Outline syllabus

- Signals in Hilbert space.
- The Fourier Series.
- The Fourier Transform and its properties.
- Convolution, energy and bandwidth.
- Delta functions.
- Linear shift invariant (LSI) systems.
- The Shannon-Whittaker sampling theorem.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **B** Baher “Analog and Digital Signal Processing” (Shelfmark 621.3822 (B), ISBN 0471623547)
- **B** Oppenheim and Willsky “Signals and Systems” (Shelfmark 621.38223 (O), ISBN 0136511759)
- **B** Stremler “Introduction to Communication Systems” (Shelfmark 621.382 (S), ISBN 0201516519)

Assessment

One formal 2 hour written examination. Format: 4 questions from 5.

MAS422: Magnetohydrodynamics

Semester 2 10 credits

Prerequisites:	MAS172 (Mechanics in Action); MAS271 (Methods for Differential Equations)
Prerequisite for:	
Cannot be taken with:	

Description

Magnetohydrodynamics has been successfully applied to a number of astrophysical problems (e.g., to problems in Solar and Magnetospheric Physics), as well as to problems related to laboratory physics, especially to fusion devices. This module gives an introduction to classical magnetohydrodynamics. Students will get familiar with the system of magnetohydrodynamic equations and main theorems that follow from this system (e.g., conservation laws, anti-dynamo theorem). They will study the simplest magnetic equilibrium configurations, propagation of linear waves, and magnetohydrodynamic stability.

Aims

- To introduce the system of magnetohydrodynamic equations.
- To describe the main properties of this system of equations.
- To show using simple examples how this system of equations can be applied to different astrophysical and laboratory phenomena.

Outline syllabus

- The system of magnetohydrodynamic equations and its main properties.
- Magnetohydrodynamics equilibria.
- Propagation of magnetohydrodynamic waves.
- Magnetohydrodynamic stability.
- Magnetic dynamo.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **A** Priest "Solar Magneto-hydrodynamics" (Shelfmark 523.72 (P), ISBN 9027718334)
- **B** Goedbloed and Poedts "Principles of Magnetohydrodynamics" (Shelfmark 538.6 (G), ISBN 9027718334)
- **B** Goossens "Introduction to Plasma Astrophysics and Magnetohydrodynamics" (Shelfmark 523.2 (G), ISBN 1402014333)

Assessment

One formal 2 hour written examination. Format: 4 questions from 5.

MAS423: Advanced Operations Research

Semester 2 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS202 (Advanced Calculus)
Prerequisite for:	
Cannot be taken with:	MAS322 (Operations Research)

Description

Mathematical Programming is concerned with the algorithms that deal with constrained optimisation problems. We consider only constraints which are linear, and for which the objective function to be maximised or minimised is also linear. These problems are not continuously differentiable; special algorithms have to be developed. The module considers not only the solution of such problems but also the important area of post-optimality analysis; i.e., given the solution can one answer questions about the effect of small changes in the parameters of the problem (such as values of the cost coefficients)? Additional topics will include the transportation and assignment problems.

Aims

- To develop the mathematical skills that will provide you with the appropriate foundations for further mathematical studies
- To enable you to analyse OR problems that may arise in your future employment.

Outline syllabus

- Graphical techniques: Converting a "word" problem into a mathematical model and, for two-dimensional problems, determining the solution using the graphical technique.
- The Simplex Method: A heuristic development of the Simplex Algorithm based on the graphical technique followed by a rigorous analysis of the algorithm.
- Artificial variables, the M-Method and the Two-Phase Simplex Method: The use of artificial variables for problems with "=" and "$\geq$" constraints; the development of the M-Method and the Two-Phase method.
- Duality and the Dual Simplex Method: The Dual problem and its relation to the Primal; methods of determining the Dual; the relation of the dual variables to shadow costs and the Simplex tableau; the Dual Simplex method.
- Elementary Sensitivity analysis: Adding and removing constraints; changing cost coefficients and right-hand side values; use of duality.
- Integer Programming: Description of dichotomy problems and 0-1 variables.
- Game Theory: Basic introduction to two-person-zero-sum games.

Module Format

Lectures	20	Tutorials	1	Practicals	0

Recommended books

A Taha "Operations Research" (Shelfmark 519.38 (T), ISBN 0131889230)

A Winston "Introduction to Mathematical Programming" (Shelfmark 519.7 (W), ISBN 0534359647)

B Bertsimas and Tsitsiklis "Introduction to Linear Optimization." (Shelfmark 519.72 (B), ISBN 1886529191)

Assessment

One formal 2 hour written examination [65%]. Format: 4 questions from 5. Mini-project [35%].

MAS424: Differential Equations (Advanced)

Semester 2 10 credits

Prerequisites:	MAS271 (Methods for Differential Equations)
Prerequisite for:	
Cannot be taken with:	MAS323 (Differential Equations: A Case Study)

Description

Differential equations arise in study of phenomena in a huge variety of circumstances; for example, biology, economics, astrophysics, weather forecasting and engineering. It follows that they are fundamental to modern applied mathematics. They also take on a very wide variety of forms. This course restricts itself to those which have a single independent variable – the ordinary differential equations (ODEs). ODEs describing a variety of physical systems are considered, with a strong emphasis being placed on showing how these equations are formulated to model the system under consideration. Methods required to formulate and solve these equations are developed in the module as necessary. The module is structured as a case-study in how important ideas in applied mathematics originally came about and were subsequently developed.

Aims

- To deepen existing understanding of how applied mathematics is developed and used by reference to the ordinary differential equation in the context of (primarily) evolutionary systems.

Outline syllabus

- Case studies from ecology, biology, chemical engineering, gravitation.
- Phase-plane methods for non-linear systems, analysis (including stability issues), diffusion, Fourier methods, reaction-diffusion, waves in biological systems, calculus of variations.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **A** Murray "Mathematical Biology" (Shelfmark 570.15118 (M), ISBN 0387952233)

- **C** Wheeler "Rethinking mathematical concepts" (Shelfmark 510 (W), ISBN 0853122849)

Assessment

One formal 2 hour written examination [75%]. Format: 4 questions from 4. Mini-project [25%].

MAS430: Analytic Number Theory

Semester 1 10 credits

Prerequisites:	MAS175 (Groups and Symmetries); MAS332 (Complex Analysis)
Prerequisite for:	
Cannot be taken with:	

Description

The aim is to investigate those properties of the natural numbers $1, 2, 3, \ldots$ arising from unique factorization; in particular, the properties of the prime numbers. Topics include the distribution of prime numbers, basic properties of the Riemann zeta function, and Euler products of L-series. The course will prove Dirichlet's Theorem on primes in arithmetic progressions, and will consider consequences of the Prime Number Theorem, sketching the proof if time permits.

Aims

- To illustrate how general methods of analysis can be used to obtain results about integers and prime numbers
- To investigate the distribution of prime numbers
- To consolidate earlier knowledge of analysis through applications

Outline syllabus

- Distribution of primes
- The Riemann zeta function
- Dirichlet series
- Dirichlet's Theorem on primes in arithmetic progression
- Implications of the Prime Number Theorem

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS435: Algebraic Topology

Semester Year 20 credits

Prerequisites:	MAS276 (Rings and Groups); MAS331 (Metric Spaces)
Prerequisite for:	
Cannot be taken with:	

Description

In this course, we will study spaces from a topological point of view. This means we will be interested in some notion of the "shape" of a space rather than distances between points, so the emphasis will no longer be on metrics. We will show how to generalise the notion of metric space to achieve this, giving the notion of topological space. Our examples will include balls, spheres, the n-holed torus, the Möbius strip, the Klein bottle, other surfaces, knots, projective spaces. We will define what it means for two spaces to be homeomorphic, and introduce the more subtle and expressive notion of homotopy equivalence, with some interesting examples. For any space we will define a group, called the fundamental group, which is a beautiful and powerful way of using algebra to detect topological features of spaces; for example we can sometimes use the fundamental group to check whether two spaces are homotopy equivalent. We will calculate the fundamental groups of a number of spaces and give some applications, including a proof of the Fundamental Theorem of Algebra, and the classification of surfaces. In the second part of the course we will study homology groups, which give a more tractable method than homotopy groups for studying higher-dimensional properties of spaces.

Aims

- Understand the ideas of topological space, continuous map, and homeomorphism between topological spaces; homotopy between two maps, and homotopy equivalence between spaces.
- Understand the definition of the fundamental group and prove its basic properties; calculate the fundamental group of some simple spaces such as $\mathbf{R}^n$, balls, spheres, projective space, n-holed torus, Klein bottle and other surfaces; the proofs of the Fundamental Theorem of Algebra and the Brouwer Fixed Point Theorem using the fundamental group.
- Understand the definition of singular homology, and calculate the homology of some simple spaces such as spheres, products of spheres and surfaces.

Outline syllabus

- **Part A:** Motivation. Reminder on metric spaces, continuous maps, open and closed sets. Definition of topological space, continuous map, path. Examples. Definition of homotopy, homotopy equivalence. The fundamental group and some examples; covering spaces. Van Kampen's theorem and application to classifcation of surfaces. Applications of the fundamental group. The Fundamental Theorem of Algebra and the Brower Fixed Point Theorem. Higher homotopy.
- **Part B:** Introduction to homology. Review of abelian groups including quotients. Low dimensions. Applications. Basic homological algebra. Singular homology. Exact sequences. Calculations of homology groups. Applications.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

A Hatcher "Algebraic Topology" [free download at http://www.math.cornell.edu/~hatcher/] (Shelfmark 513.83 (H), ISBN 0521795400)

Assessment

One formal 2.5 hour written examination. This will be marked using descriptors (as for the Level 4 Projects) rather than using a markscheme.

MAS436: Functional Analysis

Semester Year 20 credits

Prerequisites:	MAS277 (Vector Spaces and Fourier Theory); MAS331 (Metric Spaces); MAS332 (Complex Analysis)
Prerequisite for:	
Cannot be taken with:	

Description

Functional analysis is the study of infinite-dimensional vector spaces equipped with extra structure. Such spaces arise naturally as spaces of functions. As well as being a beautiful subject in its own right, functional analysis has numerous applications in other areas of both pure and applied mathematics, including Fourier analysis, study of the solutions of certain differential equations, stochastic processes, and in quantum physics. In this course we focus mainly on the study of Hilbert spaces – complete vector spaces equipped with an inner product – and linear maps between Hilbert spaces. Applications of the theory considered include Fourier series, differential equations, index theory, and the basics of wavelet analysis.

Aims

- To introduce students to the ideas and some of the fundamental theorems of functional analysis.
- To show students the use of abstract algebraic/topological structures in studying spaces of functions.
- To allow students to taste the subject with a view to further work as a postgraduate.
- To give students a working knowledge of the basic properties of Banach spaces, Hilbert spaces and bounded linear operators.
- To show students the idea of duals and adjoints.
- To show students the value of looking at the spectrum of a bounded linear operator.
- To demonstrate significant applications of the theory of functional analysis.

Outline syllabus

- Normed and Banach spaces
- Linear maps and continuity
- Spaces of continuous functions
- Hilbert spaces
- Orthonormal sets
- Spectral theory
- Fredholm operators
- Wavelets

MAS438: Fields

Semester 1 10 credits

Prerequisites:	MAS276 (Rings and Groups); MAS277 (Vector Spaces and Fourier Theory)
Prerequisite for:	
Cannot be taken with:	MAS333 (Fields)

Description

A field is a set where the familiar operations of arithmetic are possible. It often happens, particularly in the theory of equations, that one needs to extend a field by forming a bigger one. The aim of this course is to study the idea of field extension and various problems where it arises. In particular, it is used to answer some classical problems of Greek geometry, asking whether certain geometrical constructions, such as angle trisection or squaring the circle, are possible.

Aims

- To illustrate how questions concerning the complex roots of real or rational polynomial equations can quickly lead to the study of subfields of the field of complex numbers
- To consolidate previous knowledge of field theory and vector space theory
- To illustrate how the general mathematical theory of vector spaces can be used to good effect in the theory of field extensions
- To illustrate how the theory of dimensions of vector spaces can be used to prove that certain ruler and compass constructions are impossible
- To illustrate the relevance of factorization of polynomials to the theory of algebraic field extensions

Outline syllabus

- Field extensions
- Factorization of polynomials
- Simple field extensions
- Towers of fields
- Ruler and compass constructions

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Allenby "Rings, fields and groups" (Shelfmark 512.8 (A), ISBN 0340544406)

B Herstein "Abstract algebra" (Shelfmark 512.8 (H), ISBN 0023538228)
B Stewart "Galois theory" (Shelfmark 512.43 (S), ISBN 0412345404)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS439: Commutative Algebra and Algebraic Geometry

Semester Year 20 credits

Prerequisites:	MAS276 (Rings and Groups)
Prerequisite for:	
Cannot be taken with:	

Description

This module will develop both the algebraic and geometric theories of commutative rings and modules. The most basic form of interaction between these two subjects can be seen as the relationship between polynomials (seen as elements in a ring) and their graphs. This relationship can then be extended to the relationship between certain kinds of ideals in a ring and the geometric object ("graph") such an ideal describes. At a basic level, this module can be seen as the study of turning algebra into pictures and describing pictures using algebra. To do so, we will study many important properties of commutative rings and their modules, and then explore the geometric objects that arise from various algebraic properties. Interpreted in the context of complex numbers, this analogy between algebra and geometry reflects many of the basic intuitions one has about graphs of polynomial equations, but we will also consider the geometry that comes about in more exotic situations, such as over finite fields.

Aims

- To establish a basic groundwork of knowledge in commutative algebra.
- To apply that knowledge to study problems of a geometric nature.
- To develop an appropriate perspective on the techniques discussed.
- To understand the connections between algebra and geometry.

Outline syllabus

- **Commutative Algebra**: Review of rings and abelian groups. Tensor products. Modules. Direct sums and generators; Chinese Remainder Theorem. Prime ideals and radicals. Local rings. Algebras. Noetherian rings and modules. Integral extensions and Noether Normalization. Localization.
- **Algebraic Geometry**: Affine algebraic varieties. Hilbert's Nullstellensatz. Regular functions. Maps between varieties. Dimension theory. Derivations and "calculus" for algebraic varieties.

Module Format

Lectures	40	Tutorials	0	Practicals	0

Recommended books

- **B** Atiyah and MacDonald, "Introduction to Commutative Algebra" (Shelfmark 512.8 (A), ISBN 0201003619)
- **B** Eisenbud "Commutative algebra with a view toward algebraic geometry" (Shelfmark 512.8 (E), ISBN 0387942688)
- **B** Mumford "The red book of varieties and schemes" (Shelfmark 2PER510.5/LEC, ISBN 0387504974)
- **B** Reid "Undergraduate Commutative Algebra" (Shelfmark 512.8 (R), ISBN 0521452554)

Assessment

Assessment will be via 20 assigned problems, each with an equal weighting of 5%. These problems will assess the students knowledge of the key concepts, their ability to synthesize and generalize these concepts, and their ability to present proofs logically and coherently. Individual problems will be assessed via descriptor, with clear standards and sample solutions provided to students at the beginning of the module.

MAS441: Optics and Symplectic Geometry

Semester 2 10 credits

Prerequisites:	MAS201 (Linear Mathematics for Applications); MAS336 (Differential Geometry)
Prerequisite for:	
Cannot be taken with:	

Description

This course is an introduction to some of the areas of pure mathematics which have evolved from the study of optics. Optics provides a unifying thread, but no prior knowledge of the properties of light is required. Mathematical topics covered include symplectic matrices, Lagrangian subspaces and characteristic functions and, if time permits, an introduction to the Maslov class and/or symplectic manifolds. In terms of optics we cover Gaussian, linear and geometrical optics and (if time permits) an introduction to aberration.

Aims

- To provide an introduction to symplectic geometry, an important part of modern pure mathematics, in parallel with optics, which is one of its most important applications. Students are encouraged to see that the abstract formalism and the application enrich each other.
- To provide a knowledge of symplectic matrix theory, emphasizing differences and similarities with orthogonal matrices.
- To demonstrate the value of physical phenomena in understanding abstract constructions in mathematics.
- (If time permits.) To provide an introduction to the concept of smooth manifold and methods for working with higher-dimensional spaces.

Outline syllabus

- Symplectic matrices
- Light rays and lenses: Gaussian optics
- Symplectic forms
- Linear Optics
- Geometrical Optics (if time permits)
- Symplectic Manifolds (if time permits)
- Nonlinear Phenomena (if time permits)

Module Format

Lectures	20	Tutorials	0	Practicals	0

- **C** V. Guillemin and S. Sternberg "Symplectic Techniques in Physics" (Shelfmark B530.15 (G), ISBN 0-521-38990-9)

Assessment

One formal 2.5 hour written examination. Format: 4 questions from 5.

MAS442: Galois Theory

Semester 2 10 credits

Prerequisites:	MAS333 (Fields) or MAS438 (Fields)
Prerequisite for:	
Cannot be taken with:	

Description

Given a field K (as studied in MAS333/MAS438) one can consider the group G of isomorphisms from K to itself. In the cases of interest, this is a finite group, and there is a tight link (called the Galois correspondence) between the structure of G and the subfields of K. If K is generated over the rationals by the roots of a polynomial $f(x)$, then G can be identified as a group of permutations of the set of roots. One can then use the Galois correspondence to help find formulae for the roots, generalising the standard formula for the roots of a quadratic. It turns out that this works whenever the degree of $f(x)$ is less than five. However, the fifth symmetric group lacks certain group-theoretic properties that lie behind these formulae, so there is no analogous method for solving arbitrary quintic equations. The aim of this course is to explain this theory, which is strikingly rich and elegant.

Aims

- To explain the general theory of homomorphisms between fields.
- To explain the definition of Galois groups, and to compute them for cyclotomic extensions, and various extensions of small degree.
- To explain the Galois correspondence, and use it to reduce various questions in field theory to easier questions about finite groups.
- To study splitting fields and Galois theory for cubics and quartics, and to explain how they lead to algorithms for finding roots.

Outline syllabus

- Review of fields and other background
- Homomorphisms and field extensions
- Splitting fields
- Extending homomorphisms; normal field extensions; Galois groups
- Examples involving extensions of small degree
- Cyclotomic fields and their Galois groups
- Finite fields (if time permits)
- The Galois correspondence
- Cubics and quartics
- Extension by radicals and solvability.

Module Format

Assessment

One formal 2.5 hour examination. Format: 4 out of 5 questions.

MAS452: Stochastic Processes and Finance

Semester Year 20 credits

Prerequisites:	MAS207 (Continuity and Integration); MAS275 (Probability Modelling)
Prerequisite for:	
Cannot be taken with:	

Description

A stochastic process is a mathematical model for phenomena unfolding dynamically and unpredictably over time. This module studies two classes of stochastic process particularly relevant to financial phenomena: martingales and diffusions. The module develops the properties of these processes and then explores their use in Finance. A key problem considered is that of the pricing of a financial derivative such as an option giving the right to buy or sell a stock at a particular price at a future time. What is such an option worth now? Martingales and stochastic integration are shown to give powerful solutions to such questions.

Aims

- extend the student's knowledge of stochastic processes by studying martingales, stochastic calculus and diffusions;
- extend the student's ability to perform stochastic modelling in continuous time and continuous space;
- introduce Brownian motion, an important example of a stochastic process;
- introduce the basic ideas and concepts of financial markets;
- show how stochastic processes may be applied to the study of financial markets, in particular to the pricing and hedging of financial derivatives;
- develop the theory of the Black-Scholes formula in discrete and continuous time, risk-neutral valuation and the Fundamental Theorem of Asset Pricing.

Outline syllabus

- **Stochastic Processes**: Probability and measure; conditional expectation; martingales and stopping times; Brownian motion; stochastic integration; Itô calculus; stochastic differential equations.
- **Finance**: The binomial model revisited; the fundamental theorem of asset pricing; asset pricing in continuous time.

Assessment

One formal 3 hour written closed book examination.

MAS461: Medical Statistics

Semester 1   10 credits

Prerequisites:	MAS173 (Probability and Inference); MAS205 (Statistics Core) recommended; at least 70 credits of Level 3 Probability and Statistics modules or equivalent.
Prerequisite for:	
Cannot be taken with:	MAS361 (Medical Statistics)

Description

This course comprises sections on Clinical Trials and Survival Data Analysis. The special ethical and regulatory constraints involved in experimentation on human subjects mean that Clinical Trials have developed their own distinct methodology. Students will, however, recognise many fundamentals from mainstream statistical theory. The course aims to discuss the ethical issues involved and to introduce the specialist methods required. Prediction of survival times or comparisons of survival patterns between different treatments are examples of paramount importance in medical statistics. The aim of this course is to provide a flavour of the statistical methodology developed specifically for such problems, especially with regard to the handling of censored data (e.g., patients still alive at the close of the study). Most of the statistical analyses can be implemented in standard statistical packages.

Aims

- To illustrate applications of statistics within the medical field.
- To introduce students to some of the distinctive statistical methodologies developed to tackle problems specifically related to clinical trials and the analysis of survival data.

Outline syllabus

Clinical Trials:

- **Basic concepts and designs:** controlled and uncontrolled clinical trials; historical controls; protocol; placebo; randomisation; blind and double blind trials; ethical issues; protocol deviations.
- **Size of trials.**
- **Multiplicity and meta-analysis:** interim analyses; multi-centre trials; combining trials.
- **Cross-over trials.**
- **Binary response data:** logistic regression modelling; McNemar's test, relative risks, odds ratios.

Survival Data Analysis:

- **Basic concepts:** survivor function; hazard function; censoring.
- **Single sample methods:** lifetables; Kaplan-Meier survival curve; parametric models.
- **Two sample methods**: log-rank test; parametric comparisons.
- **Regression models**: inclusion of covariates; Cox's proportional hazards model; parametric and accelerated failure time models.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **A** Everitt and Rabe-Heskith "Analyzing Medical Data Using S-Plus" (Shelfmark 610.285 (E), ISBN 0387988629)
- **A** Matthews "An Introduction to Randomized Controlled Clinical Trials" (Shelfmark 615.50724 (M), ISBN 1584886242)
- **B** Altman "Practical Statistics for Medical Research" (Shelfmark 519.023 (A), ISBN 1584880392)

- **B** Collett "Modelling Survival Data in Medical Research" (Shelfmark 610.727 (C), ISBN 1584883251)

Assessment

One formal 2 hour written examination [75%]. Format: 3 questions from 4. Project [25%].

MAS462: Financial Mathematics

Semester 1   10 credits

Prerequisites:	MAS205 (Statistics Core)
Prerequisite for:	
Cannot be taken with:	MAS362 (Financial Mathematics)

Description

The discovery of the Capital Asset Pricing Model by William Sharpe in the 1960's and the Black-Scholes option pricing formula a decade later mark the beginning of a very fruitful interaction between mathematics and finance. The latter obtained new powerful analytical tools while the former saw its knowledge applied in new and surprising ways. (A key result used in the derivation of the Black-Scholes formula, Ito's Lemma, was first applied to guide missiles to their targets; hence the title 'rocket science' applied to financial mathematics.) This course describes the mathematical ideas behind these developments together with their applications in modern finance, and includes a computational project where students further explore some of the ideas of option pricing.

Aims

- To introduce students to the mathematical ideas and methods used in finance.
- To familiarise students with financial instruments such as shares, bonds, forward contracts, futures and options.
- To familiarise students with the notion of arbitrage and the notion of no-arbitrage pricing.
- To introduce the binomial tree and geometric Brownian motion models for stock prices.
- To familiarise students with the Black-Scholes option pricing method.
- To introduce the Capital Asset Pricing Model.

Outline syllabus

- Introduction, arbitrage, forward and futures contracts
- Options, binomial trees, risk-neutral valuation
- Brownian motion and share prices, the Black-Scholes analysis
- Portfolio theory, the Capital Asset Pricing Model.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **B** Capinski and Zastawniak "Mathematics for Finance: An Introduction to Financial Engineering" (Shelfmark 332.0151 (C), ISBN 1852333308)
- **B** Hull "Options, futures and other derivatives" (Shelfmark 332.645 (H), ISBN 0131499084)
- **B** Sharpe "Portfolio theory and capital markets" (Shelfmark 332.6 (S), ISBN 0071353208)

Assessment

One formal 2 hour written examination [70%]. Format: 3 questions from 4. Project [30%].

MAS463: Linear Models

Semester 1 10 credits

Prerequisites:	MAS205 (Statistics Core); MAS273 (Statistical Modelling) recommended; at least 70 credits of Level 3 Probability and Statistics modules or equivalent
Prerequisite for:	
Cannot be taken with:	MAS363 (Linear Models)

Description

The course will develop the general theory of linear models, an important class of statistical models. It will also discuss model building and model checking in the context of regression. Multiple regression will be developed in some detail. Illustration using the R software will be given throughout.

Aims

- To review and extend the students knowledge of the standard linear model.
- To develop enough of the theory to allow a proper understanding of what these methods can achieve.
- To show how these methods are applied to data, and what kinds of conclusion are possible.

Outline syllabus

- **Simple Linear Regression**: Brief introductory examples on regression and the analysis of variance.
- **The General Linear Model**: The general linear model; reduced models; replicates and lack of fit; weighted and generalized least-squares.
- **Diagnostics and Model Revision**: Examination of residuals; types of residuals; influential observations; transformations.
- **More Linear Models and Model Building**: Use of the flexibility of the general linear model; strategy for model-building and variable selection.

Module Format

Lectures	20	Tutorials	0	Practicals	0

C Seber and Lee "Linear Regression Analysis" (Shelfmark 519.51 (S), ISBN 0471415405)

Assessment

One formal 2 hour written examination [70%]. Format: 3 questions from 4. Project [30%].

MAS464: Bayesian Statistics

Semester 1 10 credits

Prerequisites:	MAS205 (Statistics Core); MAS274 (Statistical Reasoning) recommended; 70 credits of Level 3 Probability and Statistics modules or equivalent
Prerequisite for:	
Cannot be taken with:	MAS364 (Bayesian Statistics)

Description

This unit develops the Bayesian approach to statistical inference. The Bayesian method is fundamentally different in philosophy from conventional frequentist/classical inference, and has been the subject of some controversy in the past. It is, however, becoming increasingly popular in many fields of applied statistics. This course will cover both the foundations of Bayesian statistics, including subjective probability, utility and decision theory, and modern computational tools for practical inference problems, specifically Markov chain Monte Carlo methods and Gibbs sampling. Applied Bayesian methods will be demonstrated in a series of case studies using the software package WinBUGS.

Aims

- To extend understanding of the practice of statistical inference.
- To familiarize the student with the Bayesian approach to inference.
- To describe computational implementation of Bayesian analyses.

Outline syllabus

- Subjective probability.
- Inference using Bayes Theorem. Prior distributions. Exponential families. Conjugacy. Exchangeability.
- Predictive inference.
- Utility and decisions. Tests and interval estimation from a decision-theoretic perspective.
- Model checking. Robustness. Sensitivity. Bayes factors for model checking.
- Hierarchical models.
- Computation. Gibbs sampling. Metropolis-Hastings. Graphical models. Case studies.

Module Format

Lectures	20	Tutorials	0	Practicals	0

- **B** Gelman, Carlin, Stern and Rubin "Bayesian Data Analysis" (Shelfmark 519.42 (W), ISBN 0412039915)
- **B** Lee "Bayesian Statistics: An Introduction" (Shelfmark 519.542 (L), ISBN 0340814055)

Assessment

One formal 2 hour written examination [70%]. Format: 3 questions from 4. Continuous assessment [10%]. Project [20%].

MAS465: Multivariate Data Analysis

Semester 1 10 credits

Prerequisites:	MAS205 (Statistics Core); MAS274 (Statistical Reasoning) recommended
Prerequisite for:	
Cannot be taken with:	

Description

The analysis of multivariate data requires the extension of standard univariate statistical models and methods but also introduces new problems. Initial attention is given to Data Mining techniques such as summarising and displaying high dimensional data and to ways of reducing multivariate problems to more manageable univariate ones. This is followed by routine generalisations of standard distributions and statistical tests before consideration of new strategies for constructing hypothesis tests. Finally, problems specific to multivariate data such as discrimination and classification (use in medical diagnosis problems for example) are studied. Most of these methods can be implemented in standard computer packages.

Aims

- To illustrate extensions of univariate statistical methodology to multivariate data.
- To introduce students to some of the statistical methodologies which arise only in multivariate data.
- To introduce students to some of the computational techniques required for multivariate analysis available in standard statistical packages

Outline syllabus

- **Multivariate data summary**: sample estimates of mean, covariance and variance
- **Graphical displays**: scatterplots, augmented plots, Andrews' plots, special techniques.
- **Exploratory analysis and dimensionality reduction**: principal component analysis, principal component and crimcoord displays, implementation in R.
- **Construction of statistical hypothesis tests**: the likelihood ratio method and the union-intersection principle.
- **Single and two sample methods**: Hotelling's T2 test, practical implementation in R.
- **Multisample methods**: multivariate analysis of variance and connection with crimcoords, interpretation of R analyses.
- **Discriminant analysis**: probabilities of misclassification, likelihood rules, linear discriminant analysis in R.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

- **A** Cox "An introduction to multivariate data analysis" (Shelfmark 519.535, ISBN 0340760842)
- **A** Everitt "An R and S-PLUS companion to multivariate analysis" (Shelfmark 519.535, ISBN 1852338822)
- **A** Gnanadesikan "Methods for statistical data analysis of multivariate observations" (Shelfmark 519.53, ISBN 0471161195)
- **A** Mardia, Kent and Bibby "Multivariate analysis" (Shelfmark 519.53, ISBN 0124712509)
- **C** Everitt "Applied multivariate data analysis" (Shelfmark 519.53, ISBN 0340741228)
- **C** Manly "Multivariate statistical methods: a primer" (Shelfmark 519.535, ISBN 0412603004)

Assessment

One formal 2 hour written examination [75%]. Format: 3 questions from 4. Project [25%].

MAS472: Computational Inference

Semester 2 10 credits

Prerequisites:	MAS364 (Bayesian Statistics) or MAS464 (Bayesian Statistics)
Prerequisite for:	
Cannot be taken with:	

Description

This unit aims to introduce the student to some of the powerful modern tools now available for statistical inference. The tools are largely based on the exploitation of modern computing power. They free the analyst from the distributional limitations of the past and they are widely applicable, both to traditional application areas of statistics and in new situations. The emphasis in the course will be on the practical utility of the methodology, though theoretical ideas will be introduced when necessary for understanding and use. Appropriate computer packages will be used to implement the methods.

Aims

- To extend understanding of the practice of statistical inference.
- To familiarize the student with ideas, techniques and some uses of statistical simulation.
- To describe computational implementation of likelihood-based analyses.
- To introduce examples of modern computer-intensive statistical techniques.

Outline syllabus

- Computational methods for likelihoods and likelihood theory.
- Simulation. Generating techniques. Monte Carlo integration and variance reduction.
- Bootstrapping.
- Simulation and Monte Carlo testing. Randomization tests.

Module Format

Lectures	20	Tutorials	0	Practicals	0

Recommended books

B Garthwaite, Jolliffe and Jones “Statistical Inference” (Shelfmark 519.43 (G), ISBN 0198572263)

B Morgan “Elements of Simulation” (Shelfmark 519.39 (M), ISBN 0412245809)

B Robert and Casella “Introducing Monte Carlo Methods with R” (Shelfmark 518.282(R), ISBN 978-1-4419-1575-7)

Assessment

One formal 2 hour written examination [85%]. Format: 3 questions from 4. Coursework [15%].

MAS473: Extended Linear Models

Semester 2 10 credits

Prerequisites:	MAS363 (Linear Models) or MAS463 (Linear Models)
Prerequisite for:	
Cannot be taken with:	

Description

This unit considers two extensions to standard linear modelling which together dramatically extend the range of problems that can be studies and medical research. The first extension is to models for situations in which variation arises from several sources: from different life-style choices, for example, in relation to patients' responses to medical treatment, or from variations in field fertility as well as local micro-climate in the growth of crops. The second extension is to problems in which data are naturally modelled by distributions other than the Normal: count data or binary data for example. The unit will show how standard Normal theory regression methods can be profoundly generalised to deal with the relationship of response variables to explanatory factors. Applications include drug cure-rates as functions of dose, the analysis of contingency tables and the modelling of binary medical data.

Aims

- To introduce the more general ideas of Mixed Effects Models and Generalised Linear Models (GLM) by building on the familiar concepts of the linear model.
- To develop enough of the theory to allow a proper understanding of what these methods can achieve.
- To show how these methods are applied to data, and what kinds of conclusion are possible.

Outline syllabus

- **Review of Linear Models and Introduction to R**
- **Mixed Effects Models**: Grouped data. Random effects. Analysis using R.
- **Basic Theory of GLMs**: Distributions. Link functions. Deviance. Common distributions. Overdispersion. Quasi-likelihood. Residuals.
- **Binary Data**: Analysis of binary data. Logistic regression.
- **Other Distributions**: Count data (Poisson distribution). Continuous non-negative data.
- **Contingency Tables and Log-linear Models**: Two-way tables: types of table and relevant models. Three-way tables.

Module Format

Lectures	16	Tutorials	0	Practicals	4

Recommended books

A Dobson "An Introduction to Generalized Linear Models" (Shelfmark 519.53 (D), ISBN 1584881658)
A Pinheiro and Bates "Mixed-effects models in S and S-Plus" (Shelfmark 519.53 (P), ISBN 0387989579)
B Christensen "Log-linear models and Logistic Regression" (Shelfmark 519.51 (C), ISBN 0387982477)

Assessment

One formal 2 hour written examination [70%]. Format: 3 questions from 4. Project [30%].

7 Cover sheet arrangements

There are some special arrangements for when assessed coursework is to be handed in at SoMaS Reception (G12).

(i) All work that needs to be submitted to Reception needs to have a cover sheet.

(ii) Students can access the cover sheet via http://maths.dept.shef.ac.uk/maths/current.php:

  (a) log in with your university user name and password;

  (b) cover sheets become available to students one week before the deadline to avoid early submissions;

  (c) cover sheets are unique to each student – printing out a coversheet for a friend doesn't work!

(iii) This then needs to be stapled (or in a plastic wallet) and then posted into the drop box outside reception (the drop box is provided for work that is either late/early or being submitted out of office opening times).

(iv) Work submitted without a cover sheet will not be scanned in and the student will not receive an email confirming G12 have their work.

If students have any problems with regards to viewing/accessing the cover sheets, contact hickstudentsupport@sheffield.ac.uk or visit Reception to try and sort out the problem.

8 Planned schedule of courses

The next two pages contain a list of the modules we currently intend to offer next year (and, in the case of Level 4 courses, in 2013–2014). This list should be regarded as provisional. The semesters when the courses are NOT available are blacked out.

Level 3		**Semester Available**	
Module		**Autumn 2012**	**Spring 2013**

Provisional Timetable 2012–2013

Note that these times are provisional, and depend on factors such as availability of rooms: **the University is currently involved in a major programme of room renovation, and room availability is not guaranteed**. If there are changes to timetables of dual degree partners, this may also cause alterations in these times. Nevertheless, we shall try to keep to this timetable as closely as possible.

Autumn Semester 2012–2013

	Monday	Tuesday	Wednesday	Thursday	Friday
09.00–09.50	MAS331	MAS435	MAS452	MAS310 MAS439 MAS465	
10.00–10.50	MAS336 MAS420	MAS435	MAS314 MAS400		MAS360
11.00–11.50	MAS301 MAS412	MAS315 MAS361 MAS461	MAS363 MAS463	MAS364 MAS430 MAS464	MAS315
12.00–12.50	MAS312	MAS332	MAS333 MAS360 MAS438	MAS363 MAS463	MAS331
13.00–13.50	MAS452	MAS330 MAS400		MAS362 MAS436 MAS462	MAS362 MAS462
14.00–14.50	MAS310 MAS439	MAS430			MAS312 MAS411
15.00–15.50	MAS332 MAS465	MAS336 MAS420		MAS330	MAS333 MAS438
16.00–16.50	MAS364 MAS464	MAS334 MAS411		MAS314	MAS334
17.00–17.50	MAS361 MAS461				

- MAS301 and MAS400 have very few timetabled sessions.
- MAS364/MAS464 has computer sessions during two weeks; these may take place at different times.
- MAS360, MAS412, MAS435, MAS436, MAS439 and MAS452 are year-long modules.

Spring Semester 2012–2013

	Monday	Tuesday	Wednesday	Thursday	Friday
09.00–09.50	MAS342	MAS320 MAS350	MAS324 MAS422 MAS442	MAS325 MAS372	MAS341
10.00–10.50	MAS322 MAS423	MAS343		MAS452	MAS344 MAS441
11.00–11.50	MAS346 MAS452	MAS370 MAS439	MAS346	MAS323 MAS424 MAS472	MAS370 MAS439
12.00–12.50	MAS371	MAS345	MAS360 MAS441	MAS377 MAS435	MAS360 MAS473
13.00–13.50	MAS325	MAS300 MAS473	MAS345	MAS320 MAS435	MAS342
14.00–14.50	MAS372 MAS412	MAS323 MAS424 MAS472		MAS322 MAS423 MAS436	MAS377
15.00–15.50	MAS324 MAS422 MAS442	MAS371		MAS343	
16.00–16.50	MAS350	MAS341		MAS344	
17.00–17.50					

- MAS300 has very few timetabled sessions.
- MAS472 has computer sessions during two weeks; these may take place at different times.
- MAS360, MAS412, MAS435, MAS436, MAS439 and MAS452 are year-long modules.
